1 Example Technology:
Macromedia Flash & ActionScript

1.1 Multimedia authoring tools - Example Macromedia Flash
1.2 Elementary concepts of ActionScript
   Scripting in General + „History“ of ActionScript
   Objects and Types in ActionScript
   Animation with ActionScript
1.3 Interaction in ActionScript
   Handling of Mouse Events
   Classical Model-View-Controller Programming
1.4 Media classes in ActionScript

Literature:
Colin Moock: Essential ActionScript 2.0, O’Reilly 2004

Creating a “Graphically Enhanced” User Interface

• Traditional programming
  – Example: Account with credit and debit function

• Additional “multimedia” features:
  – Auto-highlighting buttons
  – Visualization of money transfer direction
  – Visualization of “low” warning
The Account Class

class Account {
    var saldo:Number = 0;
    var num:Number;

    function Account(accnum:Number) {
        num = accnum;
    }

    function debit(n:Number) {
        saldo -=n;
    }

    function credit(n:Number) {
        saldo +=n;
    }

    function getNumber():Number {
        return (num);
    }

    function getSaldo():Number {
        return (saldo);
    }
}

Model-View-Controller (MVC) Paradigm

- Model:
  - Business model, mostly independent of user interface
  - Observable by arbitrary objects (application of Observer pattern)
- View:
  - Representation on user interface
  - Observes the model
  - Asks required data from the model
- Controller:
  - Modifies values in the model
  - Is driven by user interactions, therefore bound to elements of interface
  - Handles events mainly by calling methods of the model
**Observer Design Pattern**

- Classical design pattern, made publicly conscious by Gamma/Helm/Johnson/Vlissides
- Integrated into many frameworks, e.g. Java standard library (SDK)
- Idea:
  - *Observable* is a class from which any class is derived which shall notify other objects of changes
  - *Observer* is an interface through which objects can be notified of changes
    » Providing a callback method `update`
  - Observable provides a method `notifyObservers` to actually inform observing objects
  - Observers have to register (`addObserver`)

---

**How to Realize an Observer Mechanism?**

- **Approach 1:** Look for an existing standard mechanism
  - ActionScript: Contains standard class library
  - Possible solution: Use `mx.events.EventDispatcher`
  - However: Not officially documented, not fully identical
- **Approach 2:** Re-implement the pattern
  - Not difficult for ActionScript, just port the Java library source code
  - Own class library can be defined as a local package or at a central location
- **Approach 3:** Look for somebody who has already re-implemented the pattern
  - For ActionScript 2 e.g. Colin Moock, author of "Essential ActionScript 2.0"
Excerpt from util.Observable

```java
import util.*;

/**
 * A Java-style Observable class used to represent the “subject”
 * of the Observer design pattern. Observers must implement the Observer
 * interface, and register to observe the subject via addObserver().
 */
class util.Observable {
    // A flag indicating whether this object has changed.
    private var changed:Boolean = false;
    // A list of observers.
    private var observers:Array;

    /**
     * Constructor function.
     */
    public function Observable () {
        observers = new Array();
    }

    /**
     * Adds an observer to the list of observers.
     * @param o   The observer to be added.
     */
    public function addObserver(o:Observer):Boolean {
        ...
    }
}
```

Source Code for util.Observer

```java
import util.*;

/**
 * The interface that must be implemented by all observers of an
 * Observable object.
 */
interface util.Observer {

    /**
     * Invoked automatically by an observed object when it changes.
     * @param o   The observed object (an instance of Observable).
     * @param infoObj An arbitrary data object sent by
     * the observed object.
     */
    public function update(o:Observable, infoObj:Object):Void;
}
```
Model: Observable Account Class

```javascript
import util.*;

class Account extends Observable {
    var saldo:Number = 0;
    var accNum:Number;

    function Account(an:Number) {
        accNum = an;
    }

    function debit(n:Number) {
        if (n < 0) return;
        saldo -=n;
        if (n <> 0){
            setChanged();
            notifyObservers(false);
        }
    }

    function credit(n:Number) {
        if (n < 0) return;
        saldo +=n;
        if (n <> 0){
            setChanged();
            notifyObservers(true);
        }
    }
    ...
}
```

View: User Interface Design

- Main output form is a (dynamic) text field
- However:
  - Text fields cannot carry ActionScript code
  - Text field cannot be easily associated with AS class
- How can we stay object-oriented?
- Idea: Add a specific view object which just refers to the visible text field object
Class AccountView

import util.*;
class AccountView implements Observer {
    private var saldo_txt:TextField;
    private var lowWarning_mc:MovieClip;
    private var myAccount:Account;
    private var saldo:Number;
    private function animSaldo() {
        saldo = myAccount.getSaldo();
        saldo_txt.text = String(saldo);
        if (saldo < 0)
            lowWarning_mc.gotoAndPlay("startAnim");
        else
            lowWarning_mc.gotoAndStop("stopAnim");
    }

    public function AccountView(t:TextField, l: MovieClip, a: Account) {
        saldo_txt = t;
        lowWarning_mc = l;
        myAccount = a;
        myAccount.addObserver(this);
        animSaldo();
    }

    public function update(o:Observable, infoObj:Object):Void {
        var credit:Boolean = Boolean(infoObj);
        if (credit)
            credit_mc.gotoAndPlay("startAnim");
        else
            debit_mc.gotoAndPlay("startAnim");
        animSaldo();
    }
}

More Animation...

- Extending AccountView to cover an animation for money transfers:
  - Add credit_mc, debit_mc as constructor parameters and local variables
- Call animation when update is issued by model
  - Depending on direction of money flow as given by info object

public function update (o:Observable, infoObj:Object):Void {
    var credit:Boolean = Boolean(infoObj);
    if (credit)
        credit_mc.gotoAndPlay("startAnim");
    else
        debit_mc.gotoAndPlay("startAnim");
    animSaldo();
}
Controller: User Event Handling

- Using Flash’s built-in Button class makes highlighting easy.
- Event handling code (example “credit”, “debit” is similar):

```javascript
on (release) {
    var amount:Number = Number(amount_txt.text);
    if (isNaN(amount) or (amount < 0)) {
        amount_txt.text += "?";
    } else {
        myAccount.credit(amount);
    }
}
```

Constructing the Objects in Main Timeline

**SuperBank**

Your current account balance is:
Alternative: Extending a TextField Object

- *This is from an alternative solution!*
- `saldo_txt` is a TextField object generated in the authoring tool
- Text fields cannot be linked to ActionScript classes
- A method can be added as follows (in main timeline):

```javascript
saldo_txt.update = function(){
  var saldo: Number = myAccount.getSaldo();
  saldo_txt.text = saldo;
  if (saldo < 0)
    lowWarning_mc.gotoAndPlay("startAnim");
  else
    lowWarning_mc.gotoAndStop("stopAnim");
}
```

Sounds in the Library

- Sounds are imported from a file
  (in Flash essentially WAV, MP3, AU)
  - Flash command:
    File -> Import -> Import into Library
- Sounds in the library are the raw material to be used in further design
Sound Processing in Authoring Tool

- Some simple effects can be created graphically

![Sound waveforms and editing interface](image)

Sound Objects in Time-based Animations

- Sound object:
  - Encapsulates a (pre-produced) sound clip
- A sound object is associated with a specific timeline
  - Sound is played as the time in the timeline progresses
  - There may be many sounds in one presentation
    - Main timeline
    - Individual movie clip instance timelines
  - Sounds are mixed together
- Association of sound instance (from library) to timeline
  - Either graphically (e.g. dragging sound onto frame)
  - or using ActionScript method `attachSound()`
### ActionScript Syntax for Sound Objects

- Creating a sound object:
  ```actionscript
  var soundObjectName:Sound = new Sound(TargetClip);
  ```
  Example:
  ```actionscript
  var mySound:Sound = new Sound(myMovieClip_mc);
  ```
  Omitting the `TargetClip`: Definition of global sound

- A Sound object is a *handle* like the Color object
- Controlling the sound’s volume:
  ```actionscript
  mySound.setVolume(50);
  ```
- Attaching a library sound:
  ```actionscript
  mySound.attachSound("rockMusic");
  ```

### Example: A Bouncing Basketball

- Library contains the sound of the bouncing ball
- Movement of ball and coordinated change of shadow realised by tweening
- At the frame where ball touches ground (frame 5), sound is activated (e.g. through the object inspector)
- Sound is played from frame 5 till end of clip
  - Works only well with short sounds
Dragging the Ball over the Court

Let user drag the ball & scale the ball & scale the sound!

Dynamic Adjustment of Volume (and Scale)

```javascript
var bounce:Sound = new Sound(basketball_mc);
var leftBoundary:Number = 60;
var rightBoundary:Number = 490;
var topBoundary:Number = 220;
var bottomBoundary:Number = 360;
var boundaryHeight:Number = bottomBoundary - topBoundary;

this.onMouseMove = function() {
    if (_xmouse > leftBoundary && _ymouse > topBoundary &&
        _xmouse < rightBoundary && _ymouse < bottomBoundary) {
        basketball_mc.startDrag(true);
        var topToBottomPercent = (((_ymouse - topBoundary) / boundaryHeight) * 100) / 2 + 50;
        bounce.setVolume(topToBottomPercent);
        basketball_mc._xscale = topToBottomPercent;
        basketball_mc._yscale = topToBottomPercent;
    } else {
        stopDrag();
    }
}
```
Stereo Effect: “Panning”

- Panorama position or “balance”:
  - Relative volume of left and right stereo channel
  - Controls the perceived location of a monaural audio signal
- ActionScript (Class Sound):
  Method `setPan(relativeValue)`
  - Only left channel: -100
  - Only right channel: +100
  - Centered: 0

Example: Stereo Effect for Basketball

- Sound of bouncing ball draggable with mouse to left and right
  - According adjustment of sound balance

```javascript
var leftBoundary, rightBoundary,
    topBoundary, bottomBoundary...
var boundaryHeight:Number = bottomBoundary - topBoundary;
var boundaryWidth:Number = rightBoundary - leftBoundary;
var quadrantSize:Number = boundaryWidth / 2;
var centerPoint:Number = rightBoundary - quadrantSize;

this.onMouseMove = function() {
    if (_xmouse > leftBoundary && _ymouse > topBoundary &&
        _xmouse < rightBoundary && _ymouse < bottomBoundary) {
        ...
        var panAmount = ((_xmouse - centerPoint) / quadrantSize) * 100;
        bounce.setPan(panAmount);
    }...
```
Dynamically Selected Sounds

- Sounds can be attached at runtime dynamically
  - as global sound and to movie clips
- Prerequisite in Flash:
  - Export library sound for ActionScript

- Attaching a sound from library:
  Class Sound: attachSound("library name");

- Playing the sound:
  Class Sound: start(starttime, repetitions); //time in secs
  Class Sound: stop();

Example: Random Basketball Sounds

- On mouse click: Random number between 0 and 2
  - 0: score for “North Carolina” → sound “boo” (Sound0)
  - 1: score for “Indiana” → sound “cheer” (Sound1)
  - 2: no score → sound “referee whistle” (Sound2)
- Sound names chosen such that names can be computed from number (variable dynaSounds)

- In case of score:
  - Play “net sound”
  - Show basketball score animation (score mc)
  - Update score fields of respective team (team_txt)
Code for Random Basketball Sounds

```javascript
var dynaSounds:Sound = new Sound();
var netSound:Sound = new Sound();
...
this.onMouseDown = function() {
    var randomSound = random(3);
    dynaSounds.attachSound("Sound" + randomSound);
    dynaSounds.start(0, 1);
    if(randomSound == 0) {
        northCarolina_txt.text = Number(northCarolina_txt.text) + 2;
        netSound.attachSound("Net");
        netSound.start(0, 1);
        score_mc.gotoAndPlay("Score");
    } else if(randomSound == 1) {
        indiana_txt.text = Number(indiana_txt.text) + 2;
        netSound.attachSound("Net");
        netSound.start(0, 1);
        score_mc.gotoAndPlay("Score");
    }
}
```

Code for Silencing the Dynamic Sounds

- Sound to be switched off when any key is pressed:
  - Listener concept used
    (appropriate for events broadcasted to many recipients)

```javascript
this.onKeyDown = function() {
    dynaSounds.stop();
}
Key.addListener(this);
```
Playing Video from Animations

- Embedding video information into animation
  - Leads to very large files (SWF files in the case of Flash)
- External video clips:
  - Editable separately with specialized software
  - Progressive download: play during loading
  - Video played at its own frame rate, not at the rate of the animation
- Support for external video in Flash (MX 2004):
  - FLV (Flash Video) format
  - Converters from most well-known video formats to FLV exist
  - Special Media Components for easy integration of video
    » MediaDisplay
    » MediaController
    » MediaPlayback (= MediaDisplay + MediaController)
  - Media component can also play back MP3 audio

Flash Components

- Software component: A software component is a unit of composition with contractually specified interfaces and explicit context dependencies only. A software component can be deployed independently and is subject to composition by third parties."
  ECOOP 1996, Workshop on Component-oriented Programming
- Flash component: A reusable unit of Flash design and ActionScript programming with clearly specified parameters and methods. A Flash component encapsulates a ready-made solution that can be incorporated into third-party Flash applications.
- Components delivered with Flash (MX 2004, examples):
  - User Interface components:
    » Button, CheckBox, ComboBox, DataGrid, DateChooser, Label, ProgressBar, ScrollPane, TextArea, TextInput, Window, ...
  - Data components:
    » DataHolder, DataSet, WebServiceConnector, ...
  - Manager:
    » PopUpManager, Depth Manager, ...
  - Media Components ...
Example Flash Component: Date Chooser

- Layout and basic behaviour predefined
- Component inspector allows customization, e.g.
  - Definition of string representation for days, months
  - Disabled days (not choosable)
  - Start day of week
- API allows dynamic ActionScript-based adaptation
  - E.g. setting selected date
- Components generate events

Events Generated by Media Components

- Various events are reported by Media Components to the surrounding application for flexible reaction:
  - Adjustments like change of volume
  - Media events like reaching end of media
  - User-defined events when reaching specific positions (cue events)

- Reaction to media events requires Listener objects, e.g.

  var myListener:Object = new Object();
  myListener.volume = function() {
    // actions to react on volume change
  }
  myMediaComponent.addEventListener("volume", myListener);
Example: Video with Event-Triggered Animation

Module
Playback
display

MovieClip
Placeholder for
slide show
cueBox_mc

Text field
for comments
cue_txt

Cue Points

- A cue point marks a specific point in time during media playback.
  - Cue points can be defined independently of the movie (in ActionScript)
  - When reaching a cue point, an event is fired which can be handled by ActionScript.

```actionscript
display.addCuePoint("0", 1);
display.addCuePoint("1", 8);
display.addCuePoint("2", 14);
display.addCuePoint("3", 31);
display.addCuePoint("4", 35);
display.addCuePoint("5", 53);
display.addCuePoint("6", 56);
display.addEventListener("cuePoint", displayListener);
displayListener.cuePoint = function(eventObj:Object){
  var index = Number(eventObj.target.name);
  loadMovie("cue" + index + ".jpg", "cueBox_mc");
  cue_txt.text = cueTextArray[index];
}
```
Example for Cue Points

- Names of cue points chosen in a way such that conversion to number gives an index
- Two arrays of information to be displayed in the two extra windows
  - Still pictures
  - Text information

![Image](cue2.jpg)

“Fluffy is crammed into dial-up pipe”

cueTextArray[2]

Flash Pattern: Names and Numbers

- **Problem:** Indexing and computing an index requires numbers to identify information instances. Storage in files and symbol identifiers require strings to identify information instances.
- **Solution:**
  - When a string is required to be used as an index: Choose a string representing a number and convert to number when required with function `Number()`.
  - When a number is required to be used as a string: Compute an appropriate String by concatenating a base string with the number. Choose file names and identifiers appropriately.
- **Known Uses:**
  - String-to-Number: Cue point names in above example
  - Number-to-String: File names for CueX pictures in above example; Sound names in Basketball example
