5 Programming with Animations

5.1 Animated Graphics: Principles and History
5.2 Types of Animation
5.3 Programming Animations
5.4 Design of Animations

- Principles of Animation
- Optimizing Vector Graphics
- Creating a Game Character

5.5 Game Physics

Literature:
K. Besley et al.: Flash MX 2004 Games Most Wanted,
Apress/Friends of ED 2004
- Section 5.4 mainly based on book chapter 2 by Brad Ferguson
T. Jones et al.: Foundation Flash Cartoon Animation,
Apress/Friends of ED 2007
Principles of (2D-)Animation

• Squash and Stretch
  – Shape of subject reacts to speed and force of movement

• Timing
  – E.g. ease-in and ease-out: Gives animation a sense of weight and gravity

• Anticipation, Action, Reaction, Overlapping Action
  – Anticipation: Build up energy before a movement
  – Reaction: Don’t simply stop, but show the process of stopping
  – Overlapping: Hierarchy of connected objects moves in a complex way

• Arcs
  – Every object follows a smooth arc of movement

Bouncing ball
Source: T. Jones
Squash & Stretch: Animating a Bouncing Ball

- When the ball is going up, it is fighting the force of gravity and will therefore be slower than when it falls.
- On rise and fall, the ball is stretched to give the illusion it is travelling quickly. This effect should be more extreme on the fall.
- At the top of movement, the ball has a certain hang time.
- As soon as the ball hits the ground (and not before), it gets squashed horizontally.
- A shadow animation increases the optical illusion.
- Please note: These are exaggerations for the sake of a stronger illusion.
Anticipation/Reaction: Jumping Slime Ball
An Animated Comic Character (1)
An Animated Comic Character (2)
Overlapping: Complexity of Movements
Smooth Arcs
Character Layout vs. Character Library

• Character Layout:
  – Animators draw key character poses for each scene
  – Requires many individual drawings
  – No limits for dynamic adaptation
  – Character may get off model more easily

• Character Library:
  – Uses pre-made library system for parts and poses of character
  – Multiple views of a character (view angles)
  – Eye charts, mouth charts etc.
  – Requires more preproduction time
  – Achieves higher productivity
  – Suitable for re-use of character in various episodes

• Also character layout method can benefit from symbol libraries (as in Flash)
Example: Viewing Angles (Turn-Around)

Source: T. Jones
Example: Mouth Chart

Figure 2-17. `man_mouth_a_chart` contains ten different mouth shapes.

Source: T. Jones
5 Programming with Animations

5.1 Animated Graphics: Principles and History
5.2 Types of Animation
5.3 Programming Animations
5.4 Design of Animations
   - Principles of Animation
   - Optimizing Vector Graphics
   - Creating a Game Character
5.5 Game Physics

Literature:
K. Besley et al.: Flash MX 2004 Games Most Wanted, Apress/Friends of ED 2004
– Section 5.4 based on book chapter 2 by Brad Ferguson
Complexity of Polygon Drawings

- Normal drawings in vector graphics programs (like Flash)
  - Every line has a vector point on each end
  - Every time a line makes a sharp bend, at least one new vector point is needed
  - Every time two lines intersect, yet another vector point is created

49 vector points
Optimized Vector Drawings

4 + 7 * 4 = 32 vector points

Crosshair principle: avoid intersections

Flash:
Use separate layers to draw lines which intersect.
Keep each layer free of intersections.
Optimizing a Comic Character
5 Programming with Animations

5.1 Animated Graphics: Principles and History
5.2 Types of Animation
5.3 Programming Animations
5.4 Design of Animations
   - Principles of Animation
   - Optimizing Vector Graphics
   - Creating a Game Character
5.5 Game Physics

Literature:

- Section 5.4 based on book chapter 2 by Brad Ferguson
The Story and Situation for a New Game

“The sound of the screaming alarms aboard the space cruiser abruptly awoke Space Kid, our ultimate hero of the futuristic universe, from his cryogenic nap. When our hero investigated, it was obvious his worst fears were now true. His loyal sidekick, teddy, had been bear-napped from the comfort of his own sleep chamber.

Immediately Space Kid knew there could only be one ruthless and vile enemy capable of committing such an atrocity: his longtime arch nemesis, Lord Notaniceguy. Armed only with his trusty ray gun, Super Kid changes course for Quexxon Sector-G. Although our brave hero is fully aware he’s falling for the bait in a trap, he must save Teddy.”
The Design Process

1. Create rough sketches of many different visual interpretations for the character (best with paper and pencil)
   - Brainstorming technique: Do *not* yet select!
2. Select among the gallery of characters according to compatibility with story, credibility, humour/seriousness, ...
3. Create rough sketches *(paper and pencil)* for the various animation sequences needed, e.g. run, jump, shoot, ...
   - Here usage of the authoring system can help already
4. Create optimized computer graphics for an “idle” animation.
5. Realize the animation sequences
   - Make sure that all sequences start and end with the idle position
Cartoon Animation Process

1st Pass: Blocking and timing poses to a soundtrack

2nd Pass: Inbetweening

3rd Pass: Lip syncing

4th Pass: Eye acting and expressions

Figure 6-2. The four stages in the animation process

Character Brainstorming (1)
Character Brainstorming (2)
The Final Character
Rough Sketch for “Jump” Animation
The Enemies...

- Lord Notaniceguy’s space slugs...
Physics and Animation

• Jumping character:
  – Trajectory is computed by interactive program
  – $dx$ and $dy$ values for updating the character’s position
  – Jump may have different width and height depending on user interaction

• Physics is controlled with code, not with timeline animation
  – Reaction to events (including time “ticks”)

• Consequence for movement animations (like jump):
  – Movements “as if staying on the ground”
  – Character design provides one central point for the character
    » In the middle of the bottom
    » Must be the same point across all animation phases
    » Used to determine whether ground has been hit, whether we are falling off an edge, ...
Continuity of Animation Sequences

Start and end picture of the animation sequences have to fit together.
Hierarchical Animations

Game scene

- Hero (shooting)
  - Hero body
  - Gun
- Enemy

Predefined animation (timeline animation)
Interactive animation (scripted animation)
Parallax/Multiplane Effect

- Parallax effect (game programming) / multiplane (animation):
  - Move the background at different (slower) rate than the foreground
  - Creates a sensation of depth
5 Programming with Animations

5.1 Animated Graphics: Principles and History
5.2 Types of Animation
5.3 Programming Animations
5.4 Design of Animations
5.5 Game Physics

Literature:
K. Besley et al.: Flash MX 2004 Games Most Wanted, Apress/Friends of ED 2004
– Section 5.5 partially based on book chapter 3 by Keith Peters
Apress/Friends of ED 2007
Billiard-Game Physics

• Typical problem:
  – Two round objects moving at different speeds and angles hitting each other
  – How to determine resulting speeds and directions?

• Example used here:
  – Billiard game (of course)
Flash/ActionScript Code for Moving Ball

```actionscript
class Bouncing extends Sprite {
    private var ball:Ball;
    private var vx:Number;  //Horizontal velocity
    private var vy:Number;  //Vertical velocity

    public function Bouncing() {
        init();
    }

    private function init():void {
        stage.scaleMode = StageScaleMode.NO_SCALE;
        stage.align=StageAlign.TOP_LEFT;

        ball = new Ball();
        ball.x = stage.stageWidth / 2;
        ball.y = stage.stageHeight / 2;
        vx = Math.random() * 50 - 25;
        vy = Math.random() * 50 - 25;
        addChild(ball);
        addEventListener(Event.ENTER_FRAME, onEnterFrame);
    }
}
```

...
Flash/ActionScript Code for Ball Class

package {
    import flash.display.Sprite;

    public class Ball extends Sprite {
        public var radius:Number;
        private var color:uint;
        public var vx:Number = 0;
        public var vy:Number = 0;

        public function Ball(radius:Number=40,
                                color:uint=0xff0000) {
            this.radius = radius;
            this.color = color;
            init();
        }

        public function init():void {
            graphics.beginFill(color);
            graphics.drawCircle(0, 0, radius);
            graphics.endFill();
        }
    }
}
Simple Wall-to-Wall Bouncing

... private function onEnterFrame(event:Event):void {
    ball.x += vx;
    ball.y += vy;
    var left:Number = 0;
    var right:Number = stage.stageWidth;
    var top:Number = 0;
    var bottom:Number = stage.stageHeight;

    if(ball.x + ball.radius > right) {
        ball.x = right - ball.radius;
        vx *= -1;
    } else if(ball.x - ball.radius < left) {
        ball.x = left + ball.radius;
        vx *= -1;
    }
    if(ball.y + ball.radius > bottom) {
        ball.y = bottom - ball.radius;
        vy *= -1;
    }...
}

Model and Reality

What we are doing:

New path
Position after correction
Position before correction
Boundary
Path of ball
Position before moving

Real-world situation:

New path
Never gets here
Position of impact
Boundary
Path of ball
Position before moving
Energy Loss

- Bouncing always takes away some part of energy
  - Set “bouncing factor” to value smaller than 1

```actionscript
private var bounce:Number = 0.8;
...
private function onEnterFrame(event:Event):void
{
  ...

  if(ball.x + ball.radius > right)
  {
    ball.x = right - ball.radius;
    vx *= -bounce;
  }
  else if(ball.x - ball.radius < left)
  {
    ball.x = left + ball.radius;
    vx *= -bounce;
  }
  ...
}
```
Bounce and Friction

- The surface of the table always absorbs some part of the energy and slows down the ball
  - Reduce velocity by some factor each frame

```javascript
private var friction:Number = 0.99;
...
private function onEnterFrame(event:Event):void {
    ...
    if(ball.x + ball.radius > right) {
        ball.x = right - ball.radius;
        vx *= -bounce;
    }
    else if(ball.x - ball.radius < left) {
        ball.x = left + ball.radius;
        vx *= -bounce;
    }...
    vx *= friction;
    vy *= friction;
}
```
Minimum Speed

\[ v_{eff} = \sqrt{v_x^2 + v_y^2} \]

- Needed for this: Effective speed out of x and y velocities
Collision Detection Between Balls (1)

- Two balls are able to collide.
  - Collision detection as a separate entity from the two balls
  - E.g. as part of global `onEnterFrame` handler

```javascript
private function onEnterFrame(event:Event):void {
    ball0.x += ball0.vx;
    ball0.y += ball0.vy;
    ball1.x += ball1.vx;
    ball1.y += ball1.vy;
    checkCollision(ball0, ball1);
    checkWalls(ball0);
    checkWalls(ball1);
}
```
Collision Detection Between Balls (2)

private function checkCollision(ball0:Ball, ball1:Ball):void
{
    var dx:Number = ball1.x - ball0.x;
    var dy:Number = ball1.y - ball0.y;
    var dist:Number = Math.sqrt(dx*dx + dy*dy);
    if(dist < ball0.radius + ball1.radius)
    {
        Collision detected ...
    }
}

Physics: Speed, Velocity, Mass, Momentum

• **Speed:**
  – How fast is something moving (length/time)

• **Velocity:**
  – Vector describing movement: *speed* + *direction*

• **Mass:**
  – Basic property of object, depending on its material, leads under gravity to its *weight*

• **Momentum (dt. Impuls):**
  – Mass x Velocity

• **Principle of Conservation of Momentum (dt. Impulserhaltung):**
  – Total momentum of the two objects before the collision is equal to the total momentum after the collision.
A Simple Case of Collision

• Two balls collide “head on”
• Balls have same size and same mass
Placing Balls At Collision Time

This is a simplification compared to the actual physical laws.
Physics of Collision, Step 1

We need to determine those parts of the forces which actually contribute to the reaction, i.e. the projections on the collision line.
Physics of Collision, Step 2

vx1
vy1
vy2
vx2
vx1 (old vx2)
vy1
vy2
vx2 (old vx1)
vx1 (old vx2)
Physics of Collision, Step 3
Computing Step 1

Velocity of red ball

\[ \text{velocity of white ball} \]

\[ \text{var angle} = \text{Math.atan2} (\text{dy}, \text{dx}) ; \]
Computing Step 2, Part 1

Counterclockwise rotation of vector \((x, y)\):

\[
\begin{align*}
x_1 &= \cos(\alpha) \cdot x + \sin(\alpha) \cdot y \\
y_1 &= \cos(\alpha) \cdot y - \sin(\alpha) \cdot x
\end{align*}
\]

```javascript
var angle = Math.atan2(dy, dx);

var cosa = Math.cos(angle);
var sina = Math.sin(angle);

var vx1 = cosa*redBall.vx + sina*redBall.vy;
var vy1 = cosa*redBall.vx - sina*redBall.vy;

... vx2, vy2
```
Computing Step 2, Part 2

... 

```javascript
var tempvx = vx1;
vx2 = vx1;
vx1 = tempvx;
```
Computing Step 3

Clockwise rotation of vector \((x, y)\):
\[
x_1 = \cos(\alpha) \cdot x - \sin(\alpha) \cdot y
\]
\[
y_1 = \cos(\alpha) \cdot y + \sin(\alpha) \cdot x
\]

\[
\text{redBall.vx} = \\
\quad \text{cosa*vx1} - \text{sina*vy1};
\]
\[
\text{redBall.vy} = \\
\quad \text{cosa*vy1} + \text{sina*vx1};
\]
\[
\text{whiteBall.vx} = \\
\quad \text{cosa*vx2} - \text{sina*vy2};
\]
\[
\text{whiteBall.vy} = \\
\quad \text{cosa*vy2} + \text{sina*vx2};
\]
