Today

- Sprites and **pygame**

Literature: W. McGugan, Beginning Game Development with Python and Pygame, Apress 2007
Sprites
a.k.a. Spooky things that move but are not there

- Historically:
  - something that is laid over the background
  - realized by special hardware

- Today:
  - anything that moves over the screen
  - hardware fast enough -> sprites software generated
Sprites in Pygame

- Module `pygame.sprite` provides basic classes and methods to handle sprites
- Class `pygame.sprite.Sprite` used as base class for game objects
- Group Objects are provided as containers/lists for sprites
- Collision detection included
- [http://www.pygame.org/docs/ref/sprite.html](http://www.pygame.org/docs/ref/sprite.html)
The Sprite Class

• Sprite objects **must** contain an image and a location
• `self.image` is a Surface that contains the image information
• `self.rect` is a Rect object that determines the location of the sprite
• A subclass of Sprite should also overwrite the `update()` method
• Contains derived methods that handle the object in groups:
  – `kill()` removes the sprite from all groups
  – `remove(*groups)` removes the sprite from a list of groups
  – `add(*groups)` adds the sprite to groups
  – `groups()` returns a list of groups the sprite belongs to
  – `alive()` tests whether the sprite belongs to any groups
import pygame
from pygame.locals import *

class Box(pygame.sprite.Sprite):
    def __init__(self, color, initial_position):
        pygame.sprite.Sprite.__init__(self)
        self.image = pygame.Surface((20,20))
        self.image.fill(color)
        self.rect = self.image.get_rect()
        self.rect.topleft = initial_position

    def update(self):
        pass

pygame.init()
screen = pygame.display.set_mode((640, 480), 0, 32)
box = Box((255,0,0),(0,0))
while True:
    for event in pygame.event.get():
        if event.type == QUIT:
            exit()
    screen.fill((0, 0, 0))
    screen.blit(box.image, box.rect)
    pygame.display.update()
Using the update Method

- Update can hold any number of arguments
- For efficient use of groups, sprites that do the same should have the same arguments

```python
class Box(pygame.sprite.Sprite):
    def __init__(self, color, initial_position):
        pygame.sprite.Sprite.__init__(self)
        self.image = pygame.Surface((20,20))
        self.image.fill(color)
        self.rect = self.image.get_rect()
        self.rect.topleft = initial_position
        self.speed = 300

    def update(self, time_passed):
        moved_distance = time_passed * self.speed
        self.rect.left += moved_distance
```
Using the update Method II

```python
import pygame
from pygame.locals import *
...
# Box Class here

pygame.init()
screen = pygame.display.set_mode((640, 480), 0, 32)

box = Box((255,0,0),(0,0))
clock = pygame.time.Clock()

while True:
    for event in pygame.event.get():
        if event.type == QUIT:
            exit()
    screen.fill((0, 0, 0))
time_passed = clock.tick() / 1000.0
    box.update(time_passed)
    screen.blit(box.image, box.rect)
    pygame.display.update()
```

Result:

update the sprite
import pygame
from pygame.locals import *

... # Box Class here
pygame.init()
screen = pygame.display.set_mode((640, 480), 0, 32)

box = Box((255,0,0),(0,0))
box2 = Box((0,255,0),(0,60))
box3 = Box((0,0,255),(0,120))
clock = pygame.time.Clock()

while True:
    for event in pygame.event.get():
        if event.type == QUIT:
            exit()
        screen.fill((0, 0, 0))
time_passed = clock.tick() / 1000.0
box.update(time_passed)
box2.update(time_passed)
box3.update(time_passed)
screen.blit(box.image,box.rect)
screen.blit(box2.image,box2.rect)
screen.blit(box3.image,box3.rect)
pygame.display.update()

Result:
Sprite Groups

- Sprite groups (e.g. `pygame.sprite.Group`) are basically lists for sprites
- Handle the cumbersome details for the programmer:
  - `sprites()` returns a list of the sprites in that group
  - `copy()` returns a copy of the group
  - `add(*sprites)` adds a sprite to the list
  - `remove(*sprites)` removes the specified sprites from the list
  - `has(*sprites)` determines whether all sprites are in this group
  - `update(*args)` calls the update method of all sprites in this group (requires that they use the same arguments)
  - `draw(surface)` draws all the sprites in this group to the specified surface (uses `Sprite.image` and `Sprite.rect`)
  - `clear(surface,background)` erases the last drawn sprites from the list
  - `empty()` removes all sprites from the list
import pygame
from pygame.locals import *

# Box Class here
pygame.init()
screen = pygame.display.set_mode((640, 480), 0, 32)

boxes = ([(255,0,0),(0,0)],[(0,255,0),(0,60)],[(0,0,255),(0,120)])
sprites = pygame.sprite.Group()
for box in boxes:
    sprites.add(Box(box[0],box[1]))

clock = pygame.time.Clock()

while True:
    for event in pygame.event.get():
        if event.type == QUIT:
            exit()
screen.fill((0, 0, 0))
time_passed = clock.tick() / 1000.0
    sprites.update(time_passed)
sprites.draw(screen)
    pygame.display.update()
Advanced Groups (RenderUpdates)

- Drawing the whole screen every time a sprite moves is inefficient
- RenderUpdates helps to avoid this
- Special `draw()` method:
  - `draw(*sprites)` returns a list of Rect objects that define the areas that have been changed
  - Efficient for non-animated backgrounds
Using RenderUpdates

```python
import pygame
from pygame.locals import *
...
# Box Class here
pygame.init()
screen = pygame.display.set_mode((640, 480), 0, 32)

boxes = ([[255,0,0],[0,0]],
         [[0,255,0],[0,60]],
         [[0,0,255],[0,120]])
sprites = pygame.sprite.RenderUpdates()
for box in boxes:
    sprites.add(Box(box[0],box[1]))
clock = pygame.time.Clock()

background = pygame.surface.Surface((640,480))
background.fill((0,0,0))
screen.blit(background,(0,0))

while True:
    ...
    QUIT procedure here
    time_passed = clock.tick() / 1000.0
    sprites.update(time_passed)
    rects = sprites.draw(screen)
    pygame.display.update(rects)
    sprites.clear(screen,background)

RenderUpdates group

Using RenderUpdates
- call draw and store the changed areas
- clear the changes done
```
Advanced Groups (OrderedUpdates)

- Remembers the order in which sprites are added
- Order is used for drawing the sprites to the screen
- Helps painting objects in the correct order
- Slower to add and remove sprites than other groups
Iterating Sprite Groups

```python
sprites = pygame.sprite.Group()
...
for sprite in sprites:
    print sprite
```
Collision Detection

• `Rect.collidepoint(point)` can be used to see whether a coordinate is within the area of a Rect object

• `pygame.sprite` has advanced methods to check for collisions
  – E.g. `pygame.sprite.collide_rect(a,b)` checks whether two sprites intersect
A simple collision detection

```python
import pygame
from pygame.locals import *

... pygame.init()

screen = pygame.display.set_mode((640, 480), 0, 32)
box = Box((255,0,0),(0,0))

while True:
    for event in pygame.event.get():
        if event.type == QUIT:
            exit()
        if event.type == MOUSEBUTTONDOWN:
            if box.rect.collidepoint(event.pos):
                print "in"
            else:
                print "out"
    box.update()
    screen.blit(box.image,box.rect)
    pygame.display.update()
```

RenderUpdates group

Call draw and store the changed areas

Clear the changes done
