Literature: W. McGugan, Beginning Game Development with Python and Pygame, Apress 2007
Pygame Modules

**pygame.cdrom** Accesses and controls CD drives
**pygame.cursors** Loads cursor images
**pygame.display** Accesses the display
**pygame.draw** Draws shapes, lines, and points
**pygame.event** Manages external events
**pygame.font** Uses system fonts
**pygame.image** Loads and saves an image
**pygame.joystick** Uses joysticks and similar devices
**pygame.key** Reads key presses from the keyboard
**pygame.mixer** Loads and plays sounds
**pygame.mouse** Manages the mouse
**pygame.movie** Plays movie files

**pygame.music** Works with music and streaming audio
**pygame.overlay** Accesses advanced video overlays
**pygame** Contains high-level Pygame functions
**pygame.rect** Manages rectangular areas
**pygame.sndarray** Manipulates sound data
**pygame.sprite** Manages moving images
**pygame.surface** Manages images and the screen
**pygame.surfarray** Manipulates image pixel data
**pygame.time** Manages timing and frame rate
**pygame.transform** Resizes and moves images
Pygame Modules
Testing if Modules are available on a Platform

Test:

```python
if pygame.font is None:
    print "no font module"
```

Some modules might not be available on a platform depending on the hardware settings. In this case Pygame sets them to `None`. 
```python
import pygame
import locals *
from sys import exit

player_image = 'cursor.gif'

pygame.init()
screen = pygame.display.set_mode((640, 480), 0, 32)
pygame.display.set_caption("Hello, Pygame!")

mouse_cursor = pygame.image.load(player_image).convert_alpha()

while True:
    for event in pygame.event.get():
        if event.type == QUIT:
            exit()
        screen.fill((255, 255, 255))
    x, y = pygame.mouse.get_pos()
    x -= mouse_cursor.get_width() / 2
    y -= mouse_cursor.get_height() / 2
    screen.blit(mouse_cursor, (x, y))
    pygame.display.update()
```
Events

- Module `pygame.event`
- Generated all the time by different entities
- Stored in an event queue
- `pygame.event.wait()` waits until the list is not empty
- `pygame.event.get()` returns a list of the last events
- `pygame.event.poll()` returns the next event of the queue
- The type of the event is specified by `event.type`

Print all events in the list:

```python
for event in pygame.event.get():
    print event.type
```
Events

Parameters

- Events can have parameters
- Examples:
  - QUIT: no parameters
  - MOUSEBUTTONDOWN: pos, button
  - VIDEORESIZE: size, w, h
  - Etc.

Left click with the mouse:

```python
if event.type == MOUSEBUTTONDOWN:
    if event.button == 1:
        print event
```

Output:

```
<Event(5-MouseButtonDown {'button': 1, 'pos': (231, 207)})>
```
Events

Mouse Events

• **MOUSEMOTION**: pos, rel, buttons
  – Example print event:
    ```python
    <Event(4-MouseMotion {'buttons': (1, 0, 0), 'pos': (660, 313), 'rel': (-4, -4)})>
    ```

• **MOUSEBUTTONDOWN**: pos, button
• **MOUSEBUTTONUP**: pos, button

• Example: check whether the left mouse button is pushed during mouse movement

```python
if event.type == MOUSEMOTION:
    if event.buttons[0] == 1:
        pass  # or do something
```
Events

Keyboard Events

- **KEYDOWN**: unicode, key, mod
- **KEYUP**: key, mod
  - `key` is the number of the key that has been pressed
  - `mod` represents combination keys like alt, ctrl and shift
  - `unicode` is the unicode value of the pressed key

- **Example**: check whether the left key has been pressed

```python
if event.type == KEYDOWN:
    if event.key == K_LEFT:
        pass  # or do something
```
Events

(un)blocking events

- `pygame.event.set_blocked(events)` blocks events from the event queue
- `pygame.event.set_allowed(events)` unblocks the events

- Example: block all keyboard events

  ```python
  pygame.event.set_blocked([KEYDOWN,KEYUP])
  ```
Events

custom events

• `pygame.event.post(event)` posts a user event
• The value for events created by the user must have the value of `USEREVENT` or higher

• Example:

```python
MMPROCKS = USEREVENT + 1
new_event = pygame.event.Event(MMPROCKS, message="MMP Rocks")
pygame.event.post(new_event)
```
Fonts

- `pygame.font.SysFont(font, size)` loads a system font
- `pygame.font.Font(font, size)` loads a font from a file
- `Font.render(text, aliasing, color, bg_color)` creates a surface of a text

Example:

```python
    test_font = pygame.font.SysFont("arial", 16)
    test_surface = test_font.render("test", True, (0,0,0))
    screen.blit(test_surface, (0,0))
```
Images

- Pygame can load different image types:
  - JPG
  - PNG
  - GIF (non animated)
  - BMP
  - PCX
  - TGA (uncompressed)
  - TIF
  - LBM (and PBM)
  - PBM (and PGM, PPM)
  - XPM

- Images are loaded by `pygame.image.load(image)` (returns a `Surface` object)
Images

• Saving is limited to:
  – BMP
  – JPEG
  – PNG
  – TGA

• Images are saved by `pygame.image.save(surface, file)`
Surfaces

Creating a Surface

• Surface objects are containers for images
• Used as canvases
• Even the Pygame screen is represented as a Surface

• Several functions return a Surface object (e.g. `pygame.image.load(image)`)  
• Blank surfaces can be created by calling the constructor `pygame.Surface((100,100))`
Surface 2 Image

- Any surface can directly be stored as an image
- `pygame.image.save(surface, name)`

Example:

```
pygame.image.save(screen, "name.png")
```

“cooooool!”
Surfaces

Converts

• Converts are used to convert surfaces to an efficient format
• Use `convert()` or `convert_alpha()` if the image contains transparency

Example:

```python
mouse_cursor = pygame.image.load(player_image).convert_alpha()
```
Surfaces

Clipping

• If clipping is set, only pixels in that area will be displayed
• `set_clip(Rect)`
• `set_clip()` resets the clipping area

Example:

```python
screen.set_clip(100,100,200,200)
```
Surfaces
Filling and Setting and Getting Pixels

- `fill(color)` fills the surface with the defined color
- `set_at(pos,color)` can be used to manipulate single pixels
- `get_at(pos)` returns the pixel color of a surface

```
    Set pixel 10,10 to black:
    screen.set_at((10,10),(0,0,0))
```
Surfaces
Blitting

- **blit(source, pos, sourcerect=None)** copies pixel data from one surface to another

Copy test_surface to 0,0:

```python
mouse_cursor = pygame.image.load("cursor.gif").convert_alpha()
screen.blit(mouse_cursor, (0, 0))
```
Drawing

- `pygame.draw.rect(surface, color, rect, width=0)` draws a rectangle to a surface
- `pygame.draw.polygon(surface, color, pointlist, width=0)` draws a polygon to a surface
- `pygame.draw.circle(surface, color, pos, radius, width=0)` draws a circle to a surface
- `pygame.draw.arc`, `pygame.draw.ellipse`, `pygame.draw.line` etc.

Draw an empty circle:

```python
pygame.draw.circle(screen, (0,0,0), (100,100), 100, 1)
```
Super Quick Wallpong Game
Super Quick n Dirty Wallpong Game (1)

import pygame
from pygame.locals import *
from sys import exit
import random

pygame.init()
screen = pygame.display.set_mode((640,480),0,32)
pygame.display.set_caption("Pong Pong!")

#Creating 2 bars, a ball and background.
back = pygame.Surface((640,480))
background = back.convert()
background.fill((0,0,0))
bar = pygame.Surface((10,50))
bar1 = bar.convert()
bar1.fill((0,0,255))
wall = pygame.Surface((11,471))
wall = wall.convert()
wall.fill((0,0,255))
circ_sur = pygame.Surface((15,15))
circ = pygame.draw.circle(circ_sur,(0,255,0),(7,7),7)
circle = circ_sur.convert()
circle.set_colorkey((0,0,0))

# some dimensions and start positions
bar1_x, bar1_y = 10., 215.
Super Quick n Dirty Wallpong Game (2)

```
circle_x, circle_y = 307.5, 232.5
circle_y = 420
bar1_move = 0.
speed_x, speed_y, speed_circ = 250., 250., 250.
clock = pygame.time.Clock()
while True:
    for event in pygame.event.get():
        if event.type == QUIT:
            exit()
        if event.type == KEYDOWN:
            if event.key == K_UP:
                bar1_move = -ai_speed
            elif event.key == K_DOWN:
                bar1_move = ai_speed
        elif event.type == KEYUP:
            if event.key == K_UP:
                bar1_move = 0.
            elif event.key == K_DOWN:
                bar1_move = 0.
    screen.blit(background,(0,0))
    frame = pygame.draw.rect(screen,(255,255,255),Rect((5,5),(630,470)),2)
    screen.blit(bar1,(bar1_x,bar1_y))
    screen.blit(wall,(625,5))
    screen.blit(circle,(circle_x,circle_y))
    bar1_y += bar1_move
    ....
```

Game Loop

Make it Move!
Super Quick n Dirty Wallpong Game (3)

# movement of ball
    time_passed = clock.tick(30)
    time_sec = time_passed / 1000.0
    circle_x += speed_x * time_sec
    circle_y += speed_y * time_sec
    ai_speed = speed_circ * time_sec

#since we don't know anything about collision, ball hitting bars goes like this.
    if circle_x <= bar1_x + 10.:
        if circle_y >= bar1_y - 7.5 and circle_y <= bar1_y + 42.5:
            circle_x = 20.
