   4.1 Programming a "virtual brush" .......................................... 18
   4.2 Implement: Finite Color ..................................................... 20
1. Programming and Creative Coding

1.1 Concept of this Book

The concept of the book is to get people excited for programming artistic pieces. In this book we teach basic concepts that make up building blocks for interactive and potentially artistic programs. The focus is to help the reader to create creative software and to learn how to program such software. The artistic part is up to the reader, but we hope to give good starting points, where readers can bring in their creativity.

In parts we suggest critical reflection on creative coding and programming art pieces. In the lecture at LMU this is done as discussions, that are not captured in the book. We recommend readers to show their ideas and programs to other and discuss and defend it. This aids reflection and learning, similar to what we do in the course.

Besides the programming concepts and the implementation techniques, we discuss different topics, including:
- How aesthetics can be programmed?
- Creativity vs. determined by algorithms?
- Creative information visualization vs. art?
- Evolutionary systems and creativity?
- ...

1.2 The Goal: an ∞-Exhibition

In the course we create different interactive software programs. With the selection of the topics we try to cover many different programming concepts and implementation techniques.

All the programs are designed to create changing new outputs, either after some time or based on user interaction. All programs together can then be set-up as an exhibition that is ever changing, which we call an ∞-Exhibition. If the screens with the software are set-up in a circle, where screens face outwards, a visitor of the exhibition can walk around an will always see new exhibits.
1.3 Target Group and Expected Skills

The course and book is designed for readers studying at the intersection of art, media, and technology. We expect that readers have an interest in interactive art and that they want to improve their abilities to create interactive installations.

We expect that readers have basic programming skills in processing. If readers have no programming skills at all, we suggest to do an introductory tutorial (e.g. https://processing.org/tutorials/). For readers with programming experience in another languages, we expect that they can follow the course and read up on processing details as they go along.
2. Aesthetics and Information

The oeuvre of many famous modern painters includes very abstract paintings reduced to simple geometric forms, primary colours and clear pictorial structures. When you look at such paintings, many of you will think that they are easy to copy. At first sight you can grasp the colour palette, the organisation of the forms or simply the whole picture pattern. This allows us to visually separate a Mondrian from a Malevich. But can our understanding of these images be easily formalized and captured as an algorithm?

2.1 Programming a Random Mondrian

Following this idea, the first task of the book is to use Processing to recreate a mondrianesque image. Implement a program that creates a drawing that is inspired by Mondrian.

![Example of a Mondrian Painting](image)

Figure 2.1: Example of a Mondrian Painting.

The program should create a new picture every 120 seconds or when the user presses a button on the keyboard.
### Useful Commands

```cpp
void keyPressed();
random();
randomSeed();
second();
minute();
hour();
```

The following listing is a starting point for your project.

```cpp
size(400, 400); // drawing canvas, coordinate systems
background(255); // background is white
fill(255, 0, 0); // color is red
rect(50, 100, 250, 100);
fill(0, 255, 0); // color is green
rect(250, 250, 100, 100);
fill(0, 0, 255); // color is blue
rect(50, 320, 150, 10);
fill(255, 255, 0); // color is yellow
rect(50, 340, 150, 6);
fill(255, 255, 255); // color is white
rect(50, 360, 150, 4);
fill(0, 0, 0); // color is black
rect(50, 380, 150, 3);
```

![Figure 2.2: Resulting Image from the example code.](image)

See [https://processing.org/reference/random_.html](https://processing.org/reference/random_.html) for examples how to use the random function.
2.2 Random Creation and Aesthetics

Experiment with the parameters in the random creation. Explore the impact of parameters such as
the size, dimension, line width, colors, and number of element on the aesthetics of the resulting
picture.

Why are some pictures are aesthetically more pleasing than others? How can you change your
algorithm to always create aesthetic drawings, while still having a great variety?

2.3 Encoding Information in Art

People have discussed the idea of informative art, see [Fer07; HS03; RSH00]. Can this utilitarian
approach to creating visual displays based on known artworks be considered art?

Create a display that shows the time. Take a well known artwork as inspiration and encode the time
in your visualization (a 15 minutes resolution is sufficient). To a casual observer it should not be
apparent that the visualization shows the time.

What are the difficulties in designing such a visual display?

The following listing shows a basic clock. You can use this as a starting point for your own
project.

```cpp
// Variablen definieren - außerhalb von setup() und draw()
// da sie in beiden Funktionen verwendet werden
int stunde, minute, sekunde;

void setup() {
  // Fenstergroesse festlegen
  size(260, 100);

  // Variablen mit 0 initialisieren
  stunde = 0;
  minute = 0;
  sekunde = 0;

  // die Funktion draw() wird 2x pro Sekunde ausgeführt
  framerate(2);
}

void draw() {
  // loesche den Hintergrund: setze ihn schwarz: background(0);
  // setze Zeichenfarbe fuer Text und Recheck: weiss
  fill(255, 255, 255);

  // speichere in den Variablen die aktuelle Zeit
  stunde = hour();
  minute = minute();
  sekunde = second();

  // Kontrollausgabe der Zeit in der Console - kann später
geloescht werden
  // in processing kann man mit "+" einen String aus Buchstaben und
  // Zahlenbauen
  println(stunde + ":" + minute + ":" + sekunde);

  // zeige die Zeit im Fenster an
  textSize(32);
  text(stunde + ":" + minute + ":" + sekunde, 10, 30);

  // zeichne einen Sekundenbalken
```
2.4 Tasks - 1st lecture

In the 1st session we try to mimic paintings of the famous dutch painter Piet Mondrian. He is famous for his abstract paintings that are reduced to a minimal palette of colors and geometric structures. His systematic approach invites to be recreated with algorithms.

Preparation

If Processing isn’t already installed on your computer, go to https://processing.org/download/ download the program and install it on your machine. Open some example sketches and familiarize yourself with the Processing IDE. If you feel comfortable, proceed with the following task.

Breakout Session

During the following task we try to approach the generation of random Mondrianesque images in a systematic way. Step by step we go from the analysis of real and fake Mondrians, over theoretical concepts for the description of Mondrianesque structures, to working implementations of the algorithm.

• Search on the internet for pictures of the painter Mondrian (see Figure 2.3). What are the connecting commonalities? Can you spot artworks not painted by Mondrian? Try to figure out the "recipe" that makes a distinguishable Mondrian.
• Let us discuss your approach to generate Mondrianesque images with the help of an algorithm. Try to sketch such structures and formalize them first.
• Try to implement one of the approaches we discussed in the plenum. Does it lead to the expected result? Does it work as simply as expected or have there been unexpected complications?
• If your algorithm is working, try to extend it to add your own style to the generated "Mondrians". Tweak parameters, change the color palette or even introduce more randomness.

Discussion

We just created algorithms that mimic the style of a famous artist. Let us discuss your impressions and thoughts along the way. As a starting point think about the following questions:

• Can you call the product of these algorithms "art"?
• Can art in general be scripted? (Pollock, Warhol, ...)
• Does the used technology influence such a differentiation? (Style transfer performed with neural networks vs classic "conditional" algorithms)

Homework

1. Reading: Read the following papers [Fer07; HS03; RSH00] and write a short (300-500 words) essay on Informative Art. Your essay should contain an explanation what it is, why people would want to do it, pros and cons.
2. **Implementation:** Create a display that shows the time. Take Mondrian algorithm and encode the time in your visualization (a 15 minutes resolution is sufficient).

3. **Collect feedback on your implementation.** Record 3 videos from people seeing your implementation (15 seconds each).
