

# Smart Graphics: Graphics and Perception

Lecture „Smart Graphics“

Andreas Butz

26.10.2010

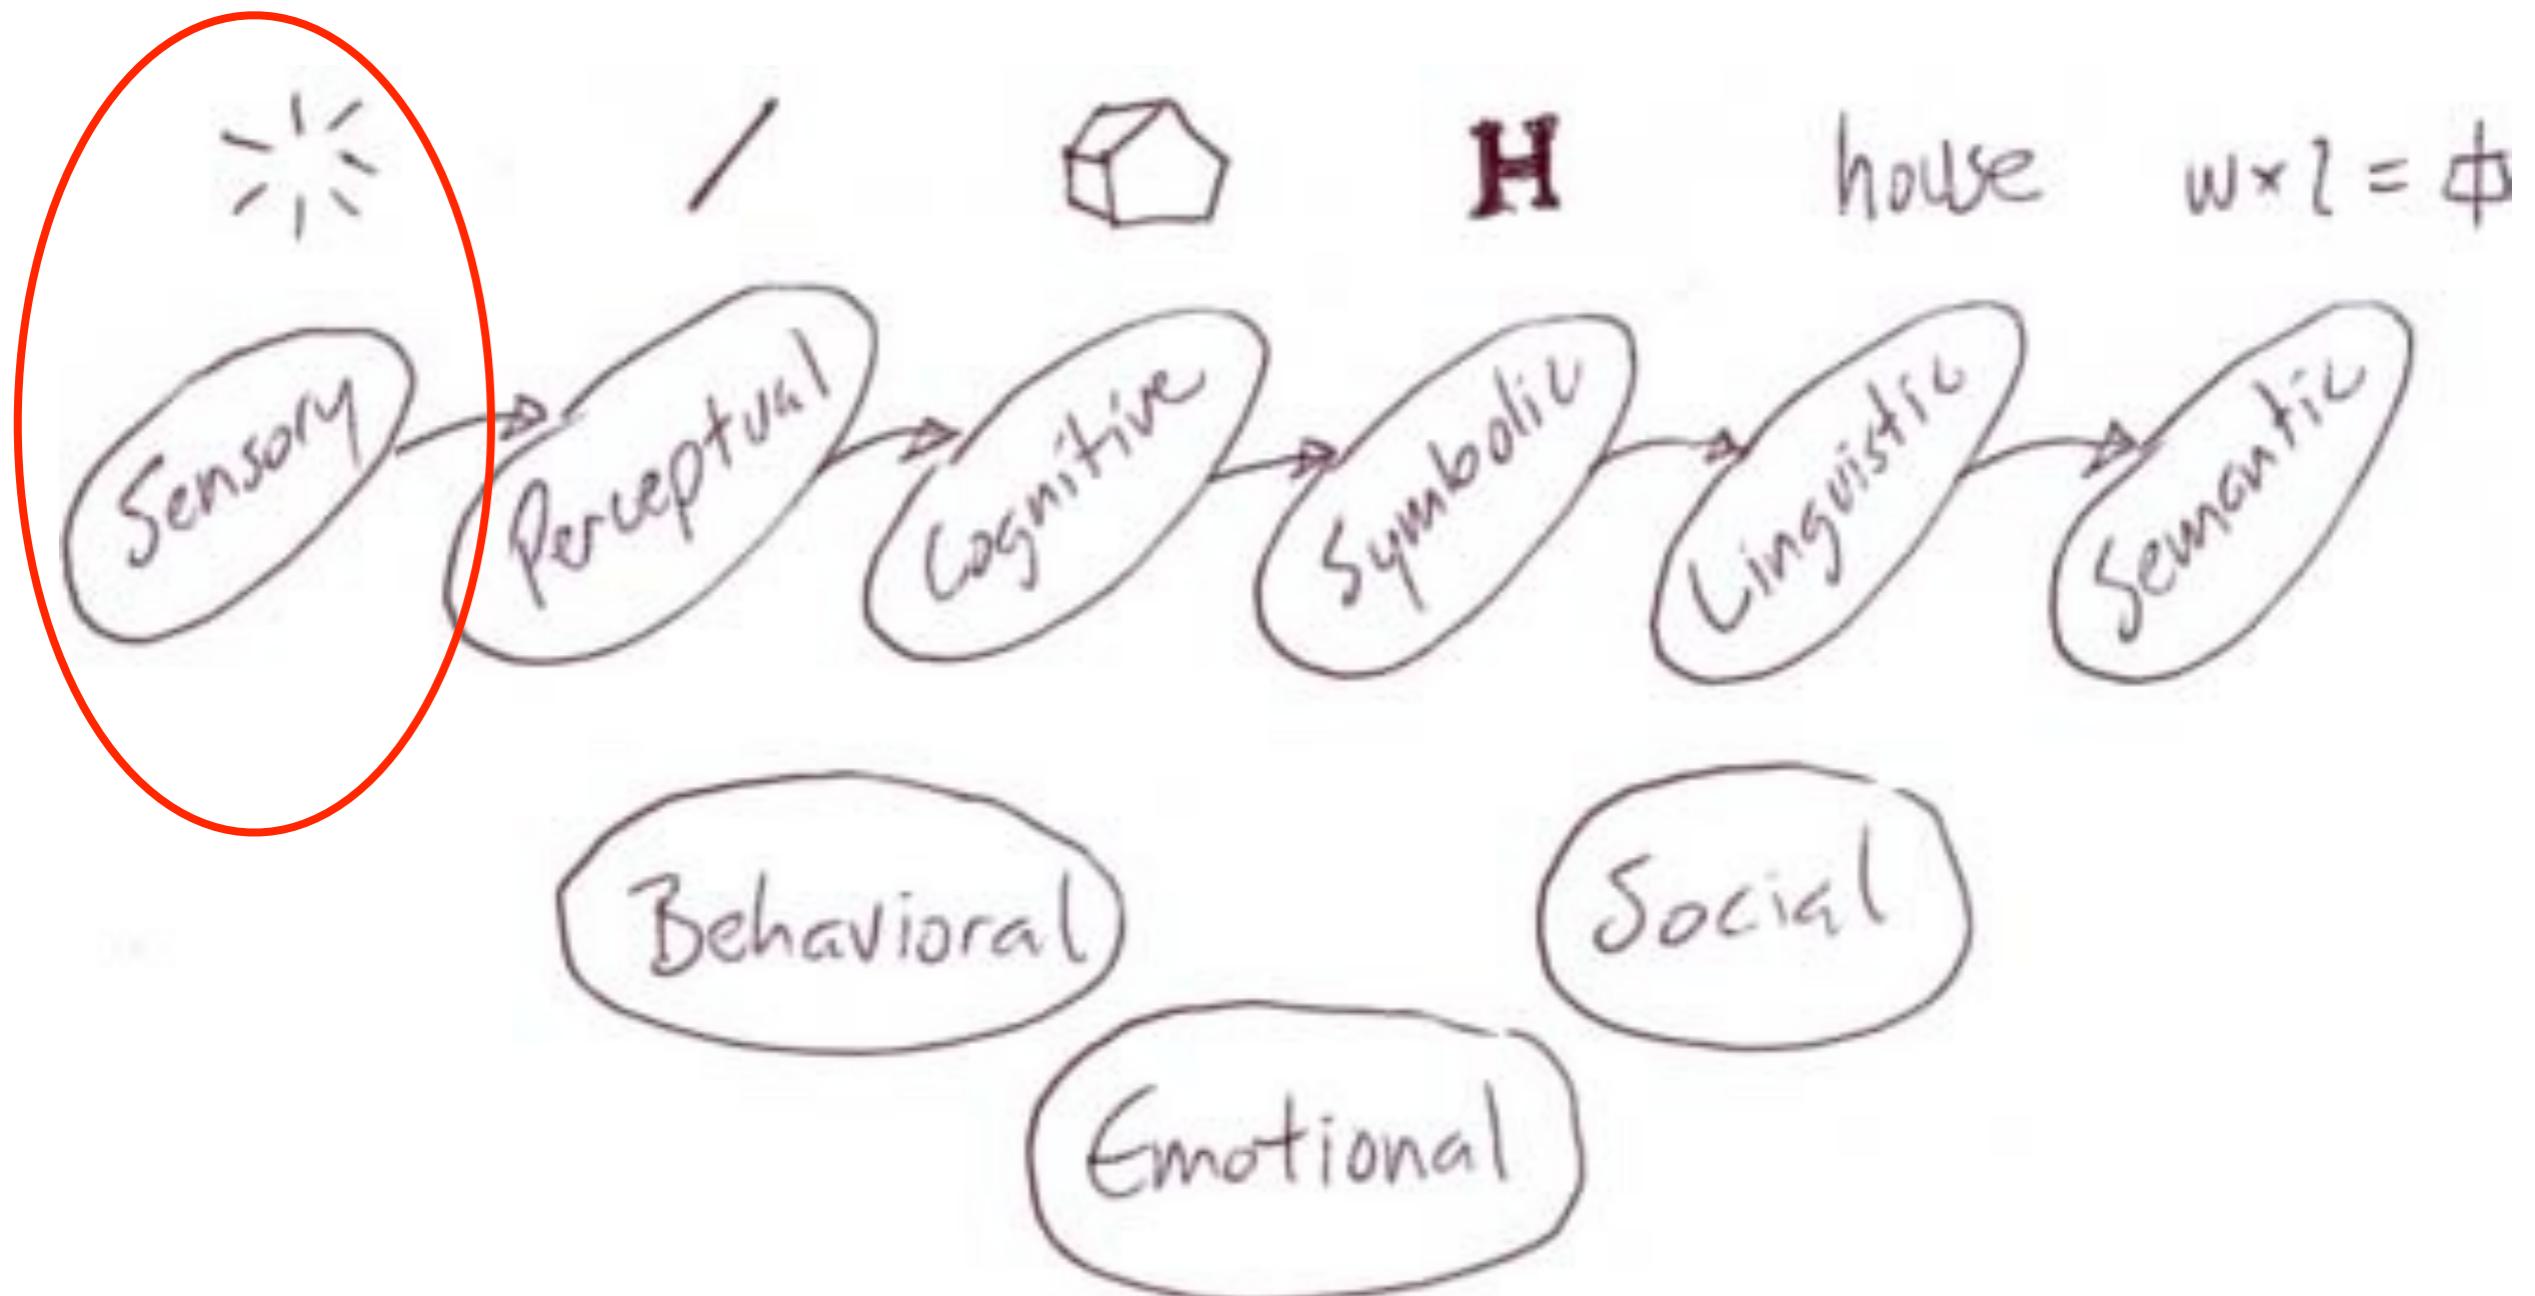

# Topics Today

- Paley's knowledge acquisition pipeline
- A classical model of human perception
- Effects at different stages of perception
- Some Illusions and experiments
- An example UI using effects from different stages of perception

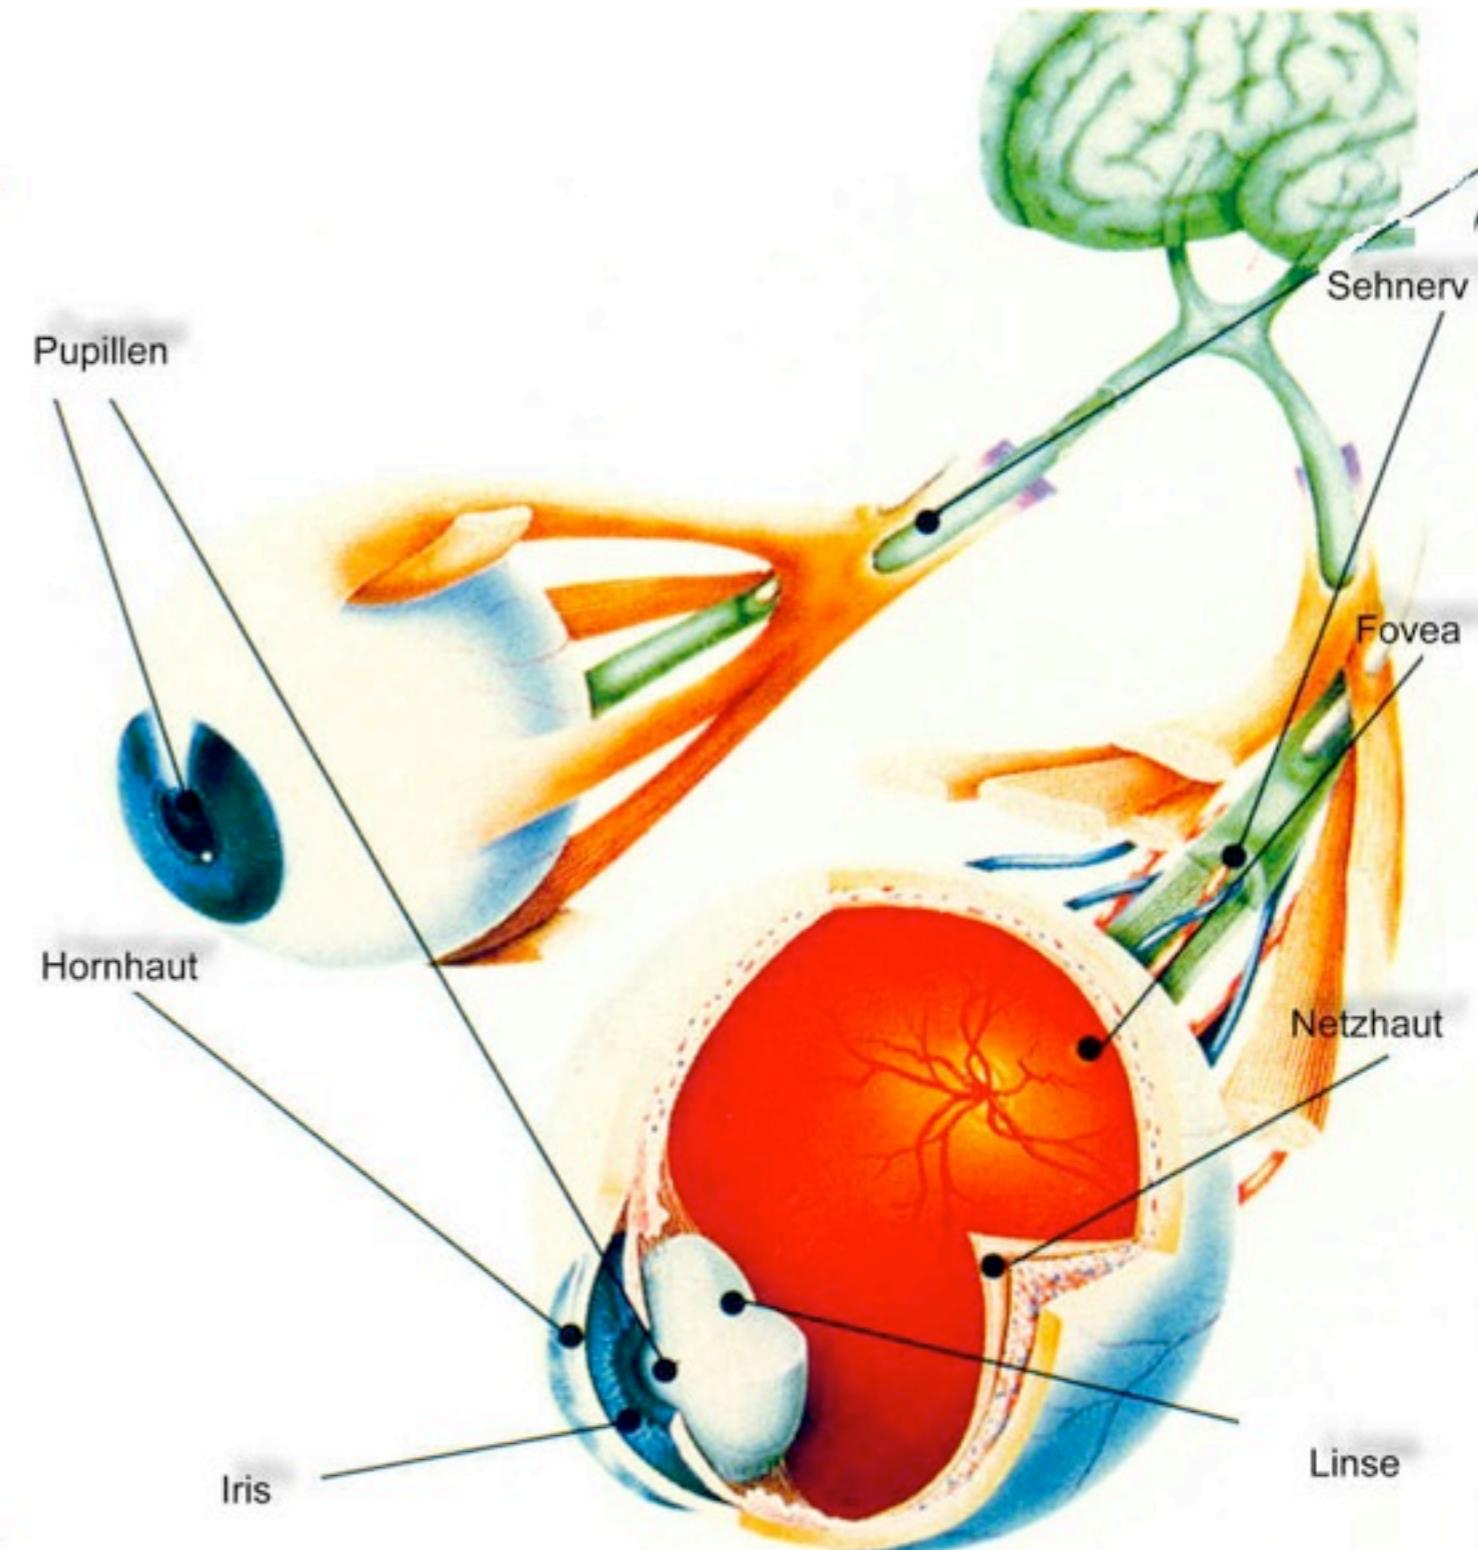

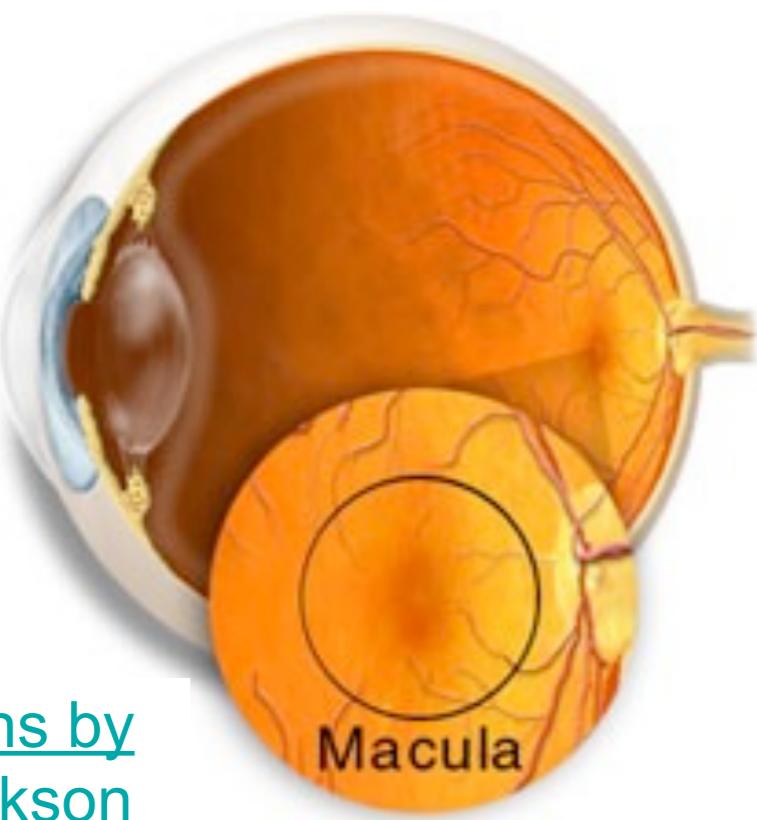

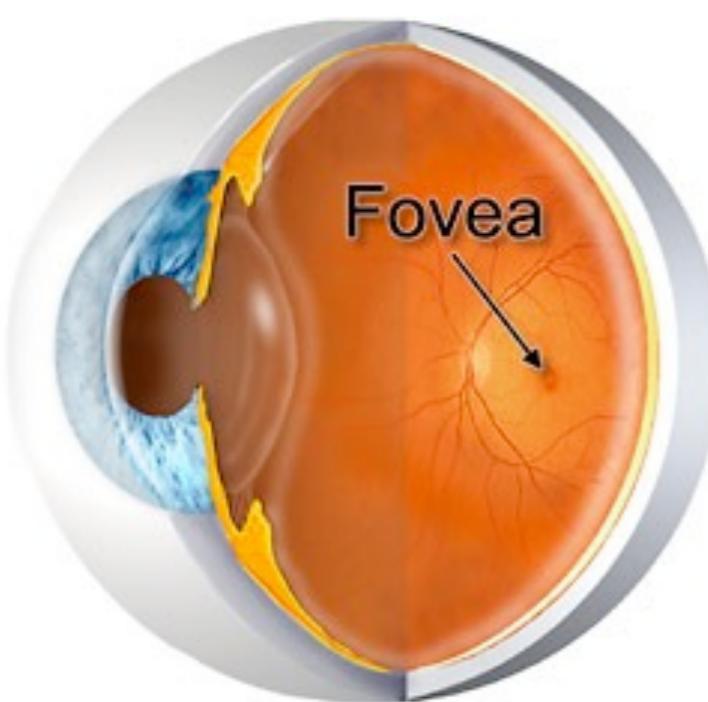

# Knowledge acquisition pipeline

[W. Bradford Paley, SG 2003]

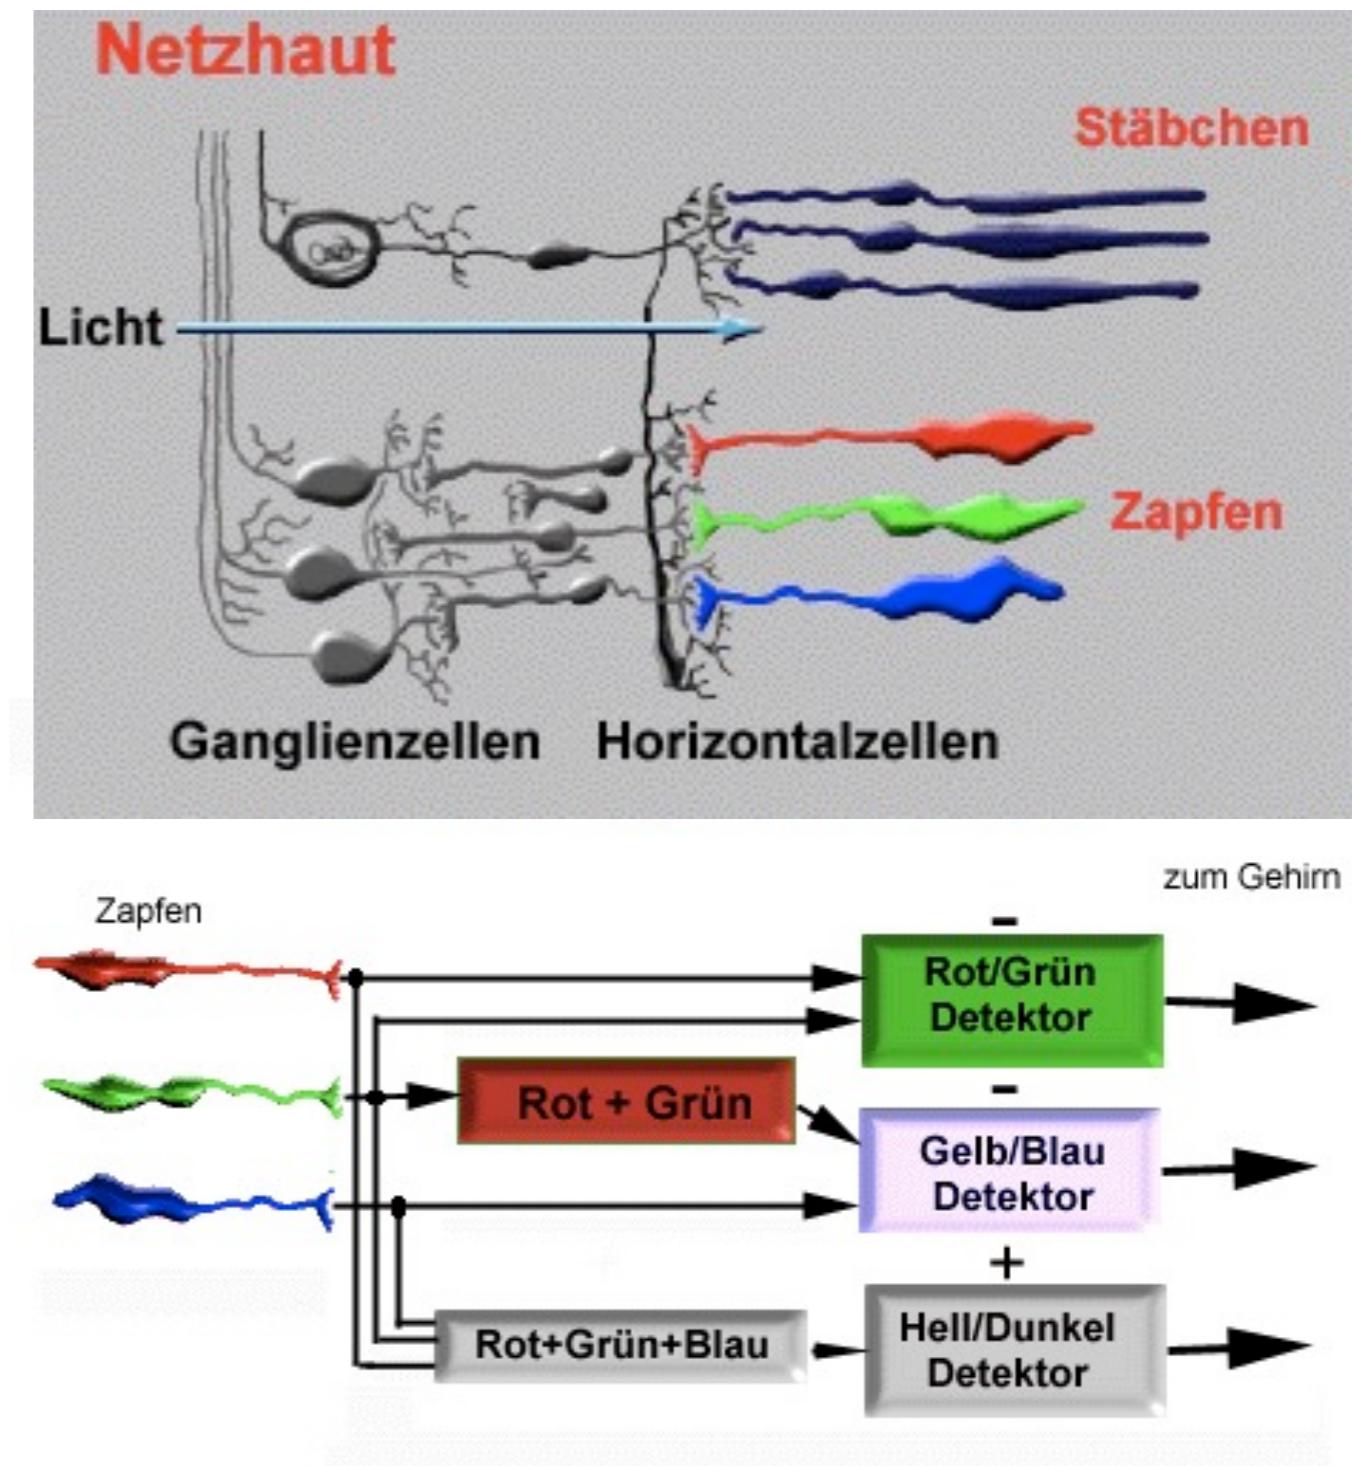

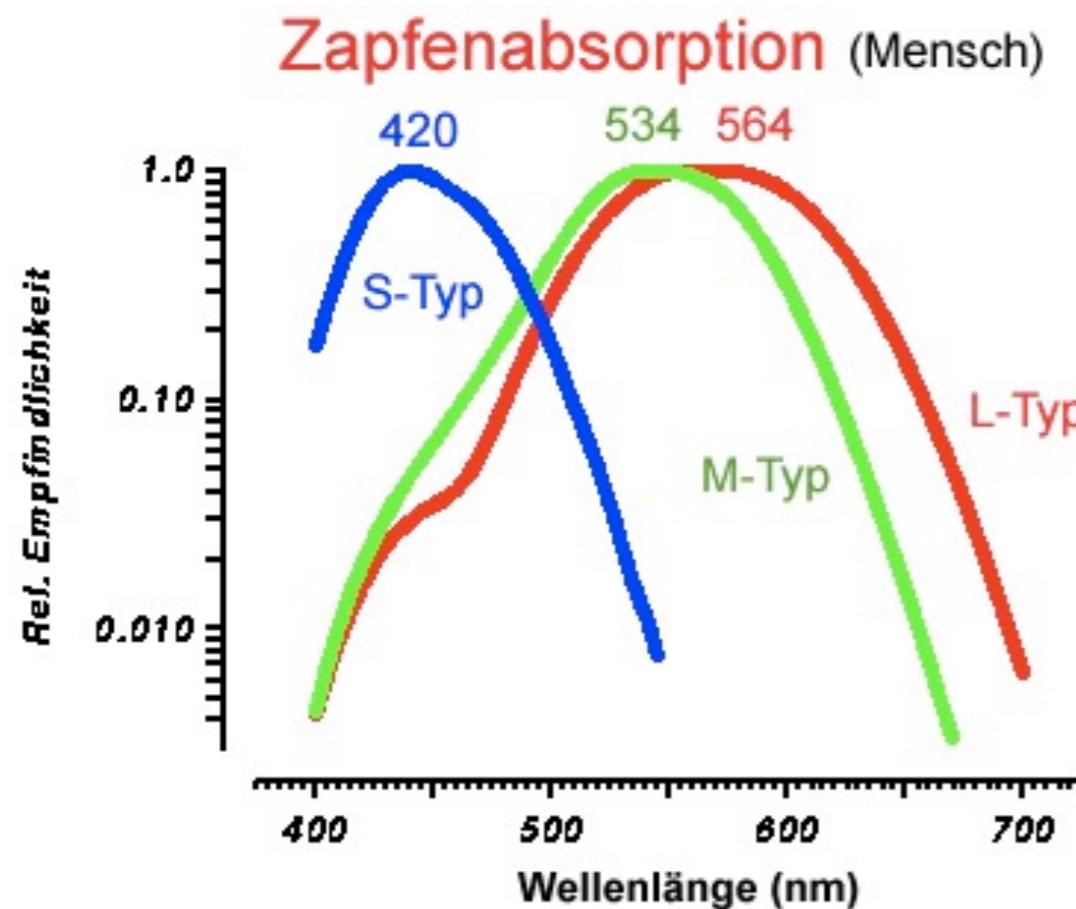

Simplified model of human sensemaking processes,  
useful for designing visual representations

# The human eye

Illustrations by  
Mark Erickson

# Die Netzhaut

- Zapfen arbeiten bei höherer Lichtintensität
- Verteilung auf der Netzhaut im Verhältnis 1:20:40
- Stäbchen arbeiten bei niedriger Lichtintensität

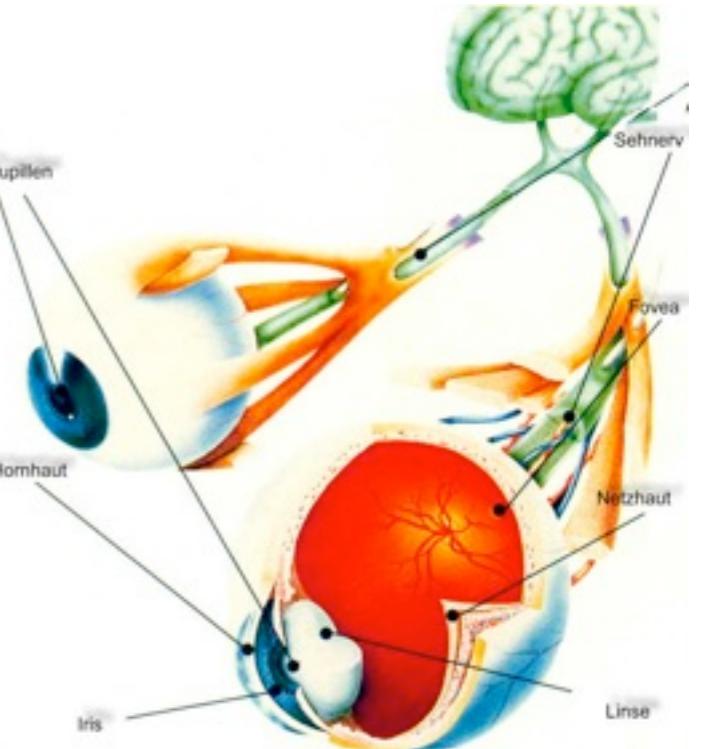

# Color blindness

- Most prominent kind:  
red/green blindness
  - ~8% of men
- Simulation with  
[vischeck](#)

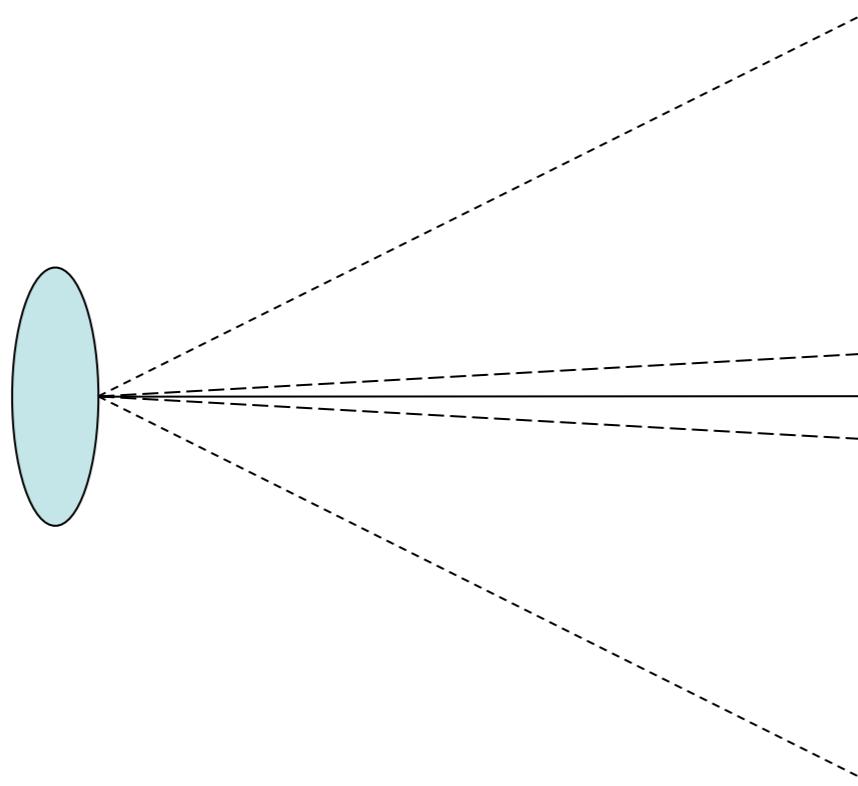

# Human eye: strengths and limitations

- Very high dynamic range
  - $2^{20} = 1:1.000.000$  with iris adaptation
  - $2^{10} = 1:1.000$  at given iris aperture
  - → more than most monitors
- Bad color vision in dark conditions
- Best contrast perception in red/green
- Limited temporal resolution (reaction speed)
- Good resolution and color in central area (macula)
- Maximum resolution and color only in the very center (fovea)
- Maximum angular resolution 1 arc minute = 1/60 degree

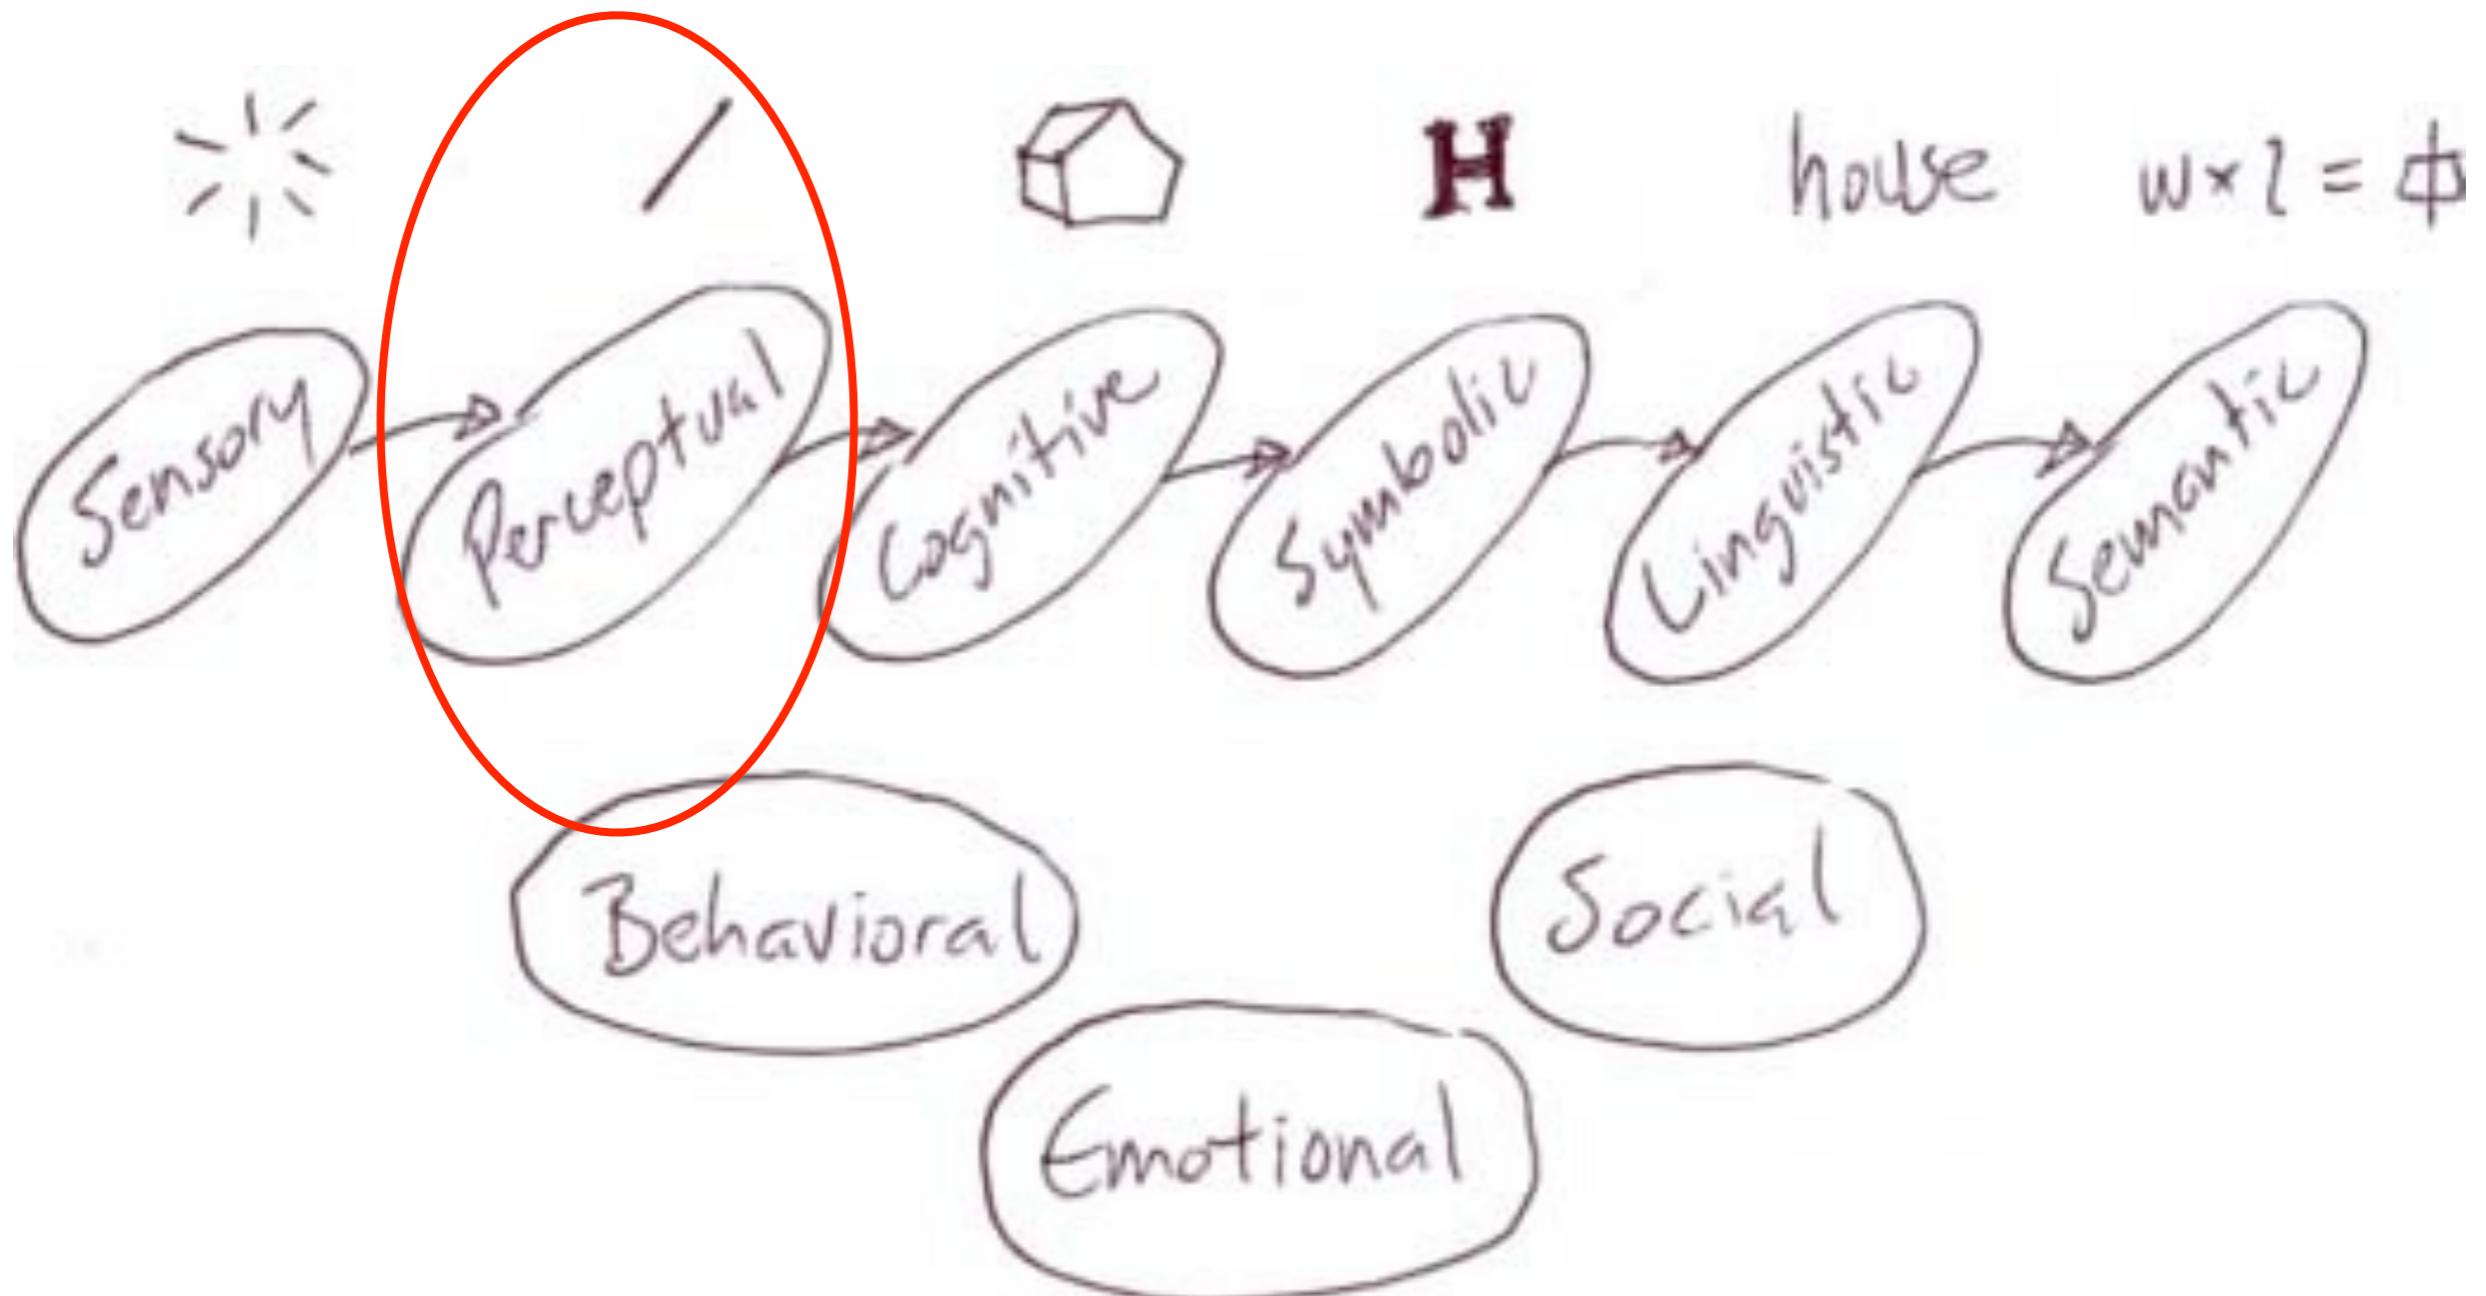

# How much resolution do we need?

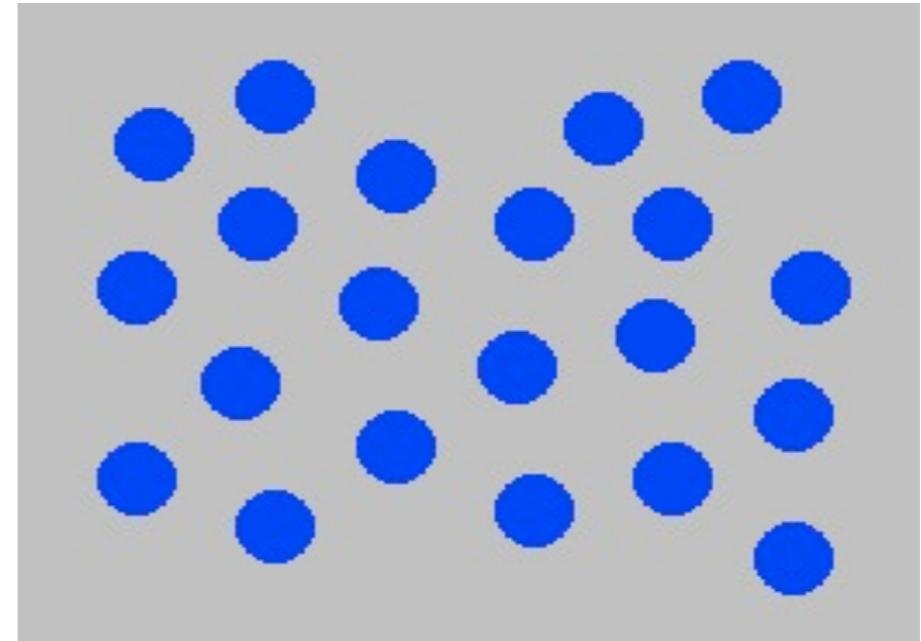

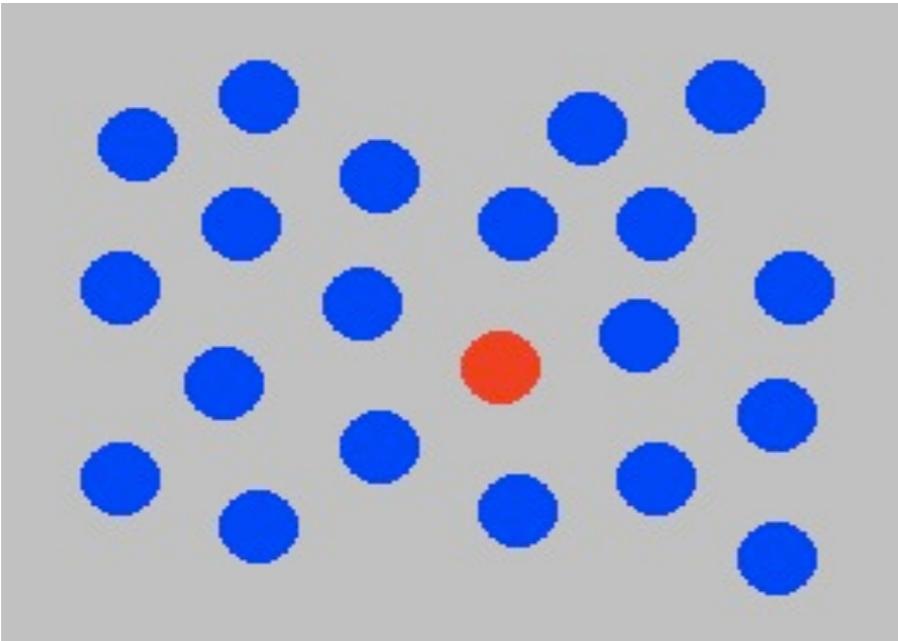

- Assumption: viewing distance = horiz. image width
- Horiz. Viewangle =  $2 \cdot \text{atan } 0.5 = 53$  degrees
- Max. angular resolution of the eye = 1/60 degree
- → Max. horiz. resolution =  $53 \cdot 60 = 3.180$  pixels
- Viewing distance of A4 paper = 10 inch → 300dpi

# Knowledge acquisition pipeline

[W. Bradford Paley, SG 2003]

# Preattentive Perception

Viewer can rapidly and accurately determine whether the target (red circle) is present or absent. Difference detected in color.

Hearst, 2003

**Pre-attentive** processing:

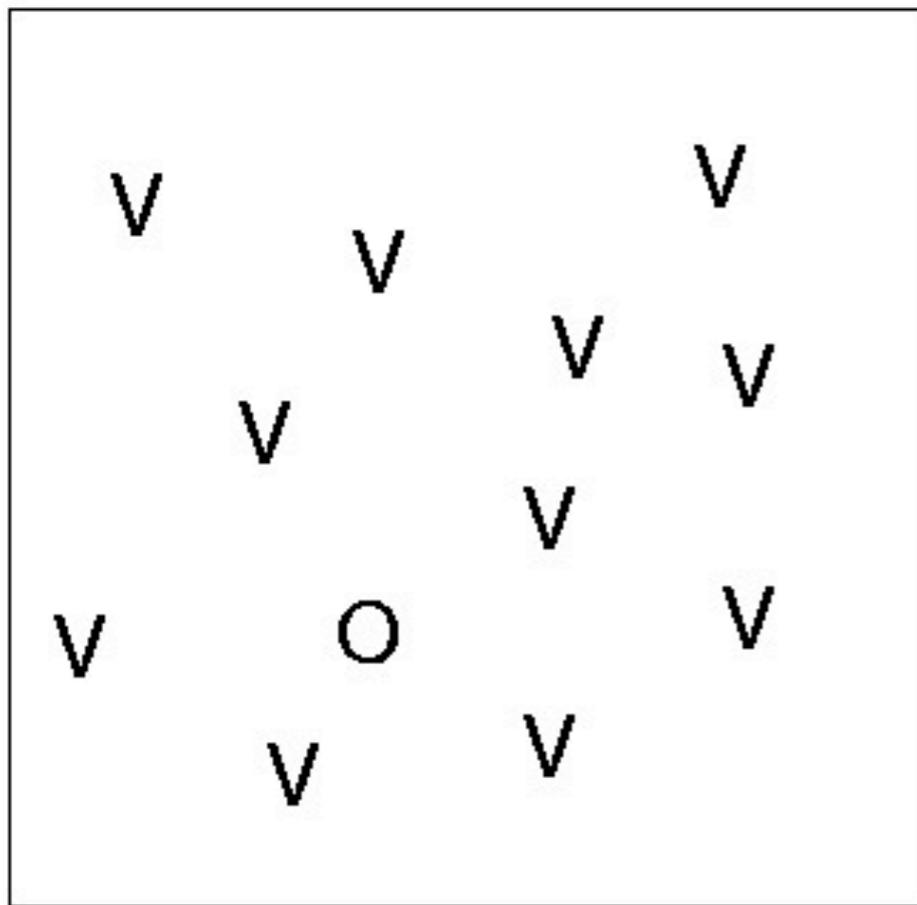

Processed without focusing attention Constant time < 200-250 ms independent of number of distractors  
(Eye movements take 200 ms)

# Attentive Perception

- Aggregation of several attributes
- Goal-oriented comparison of attributes
- Takes longer, but leads to better memorization of images

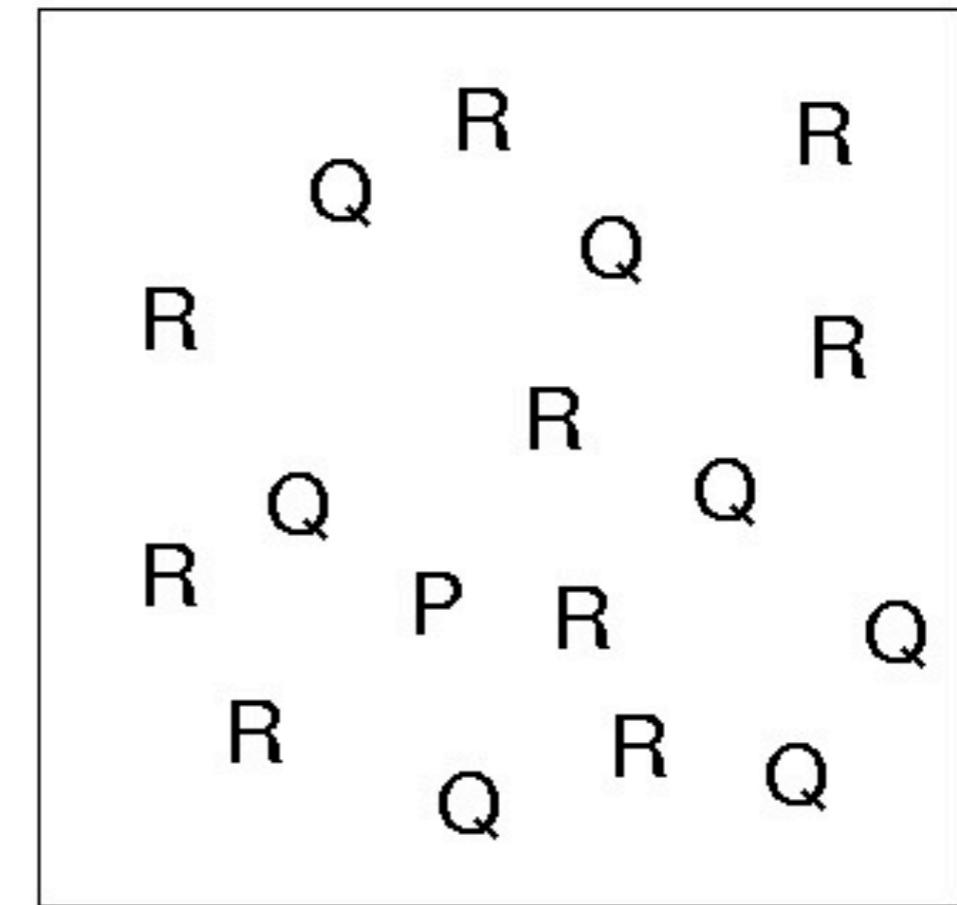

# Visual Search

A)

Preattentive Search

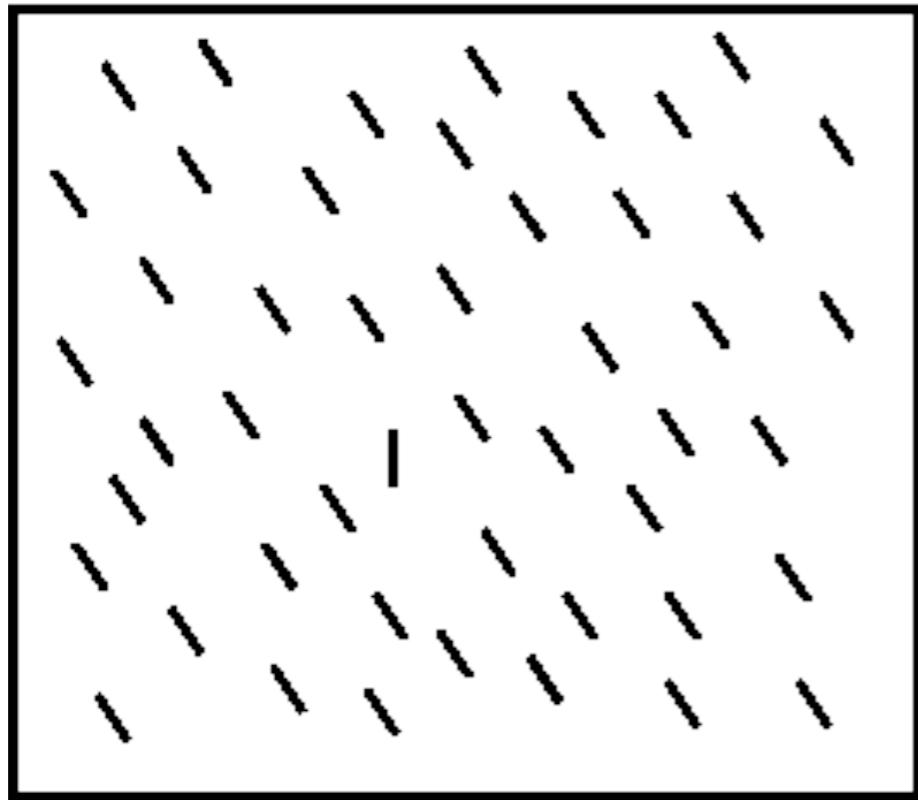

B)

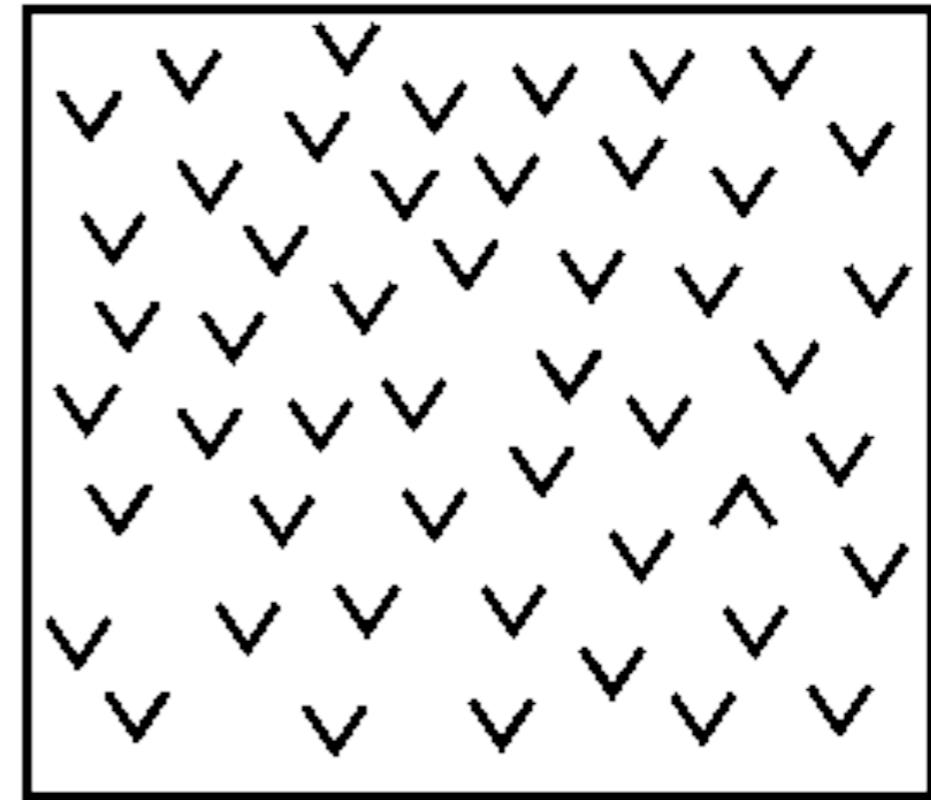

Attentive Search

# Preattentive and Attentive Pattern Recognition

seriell

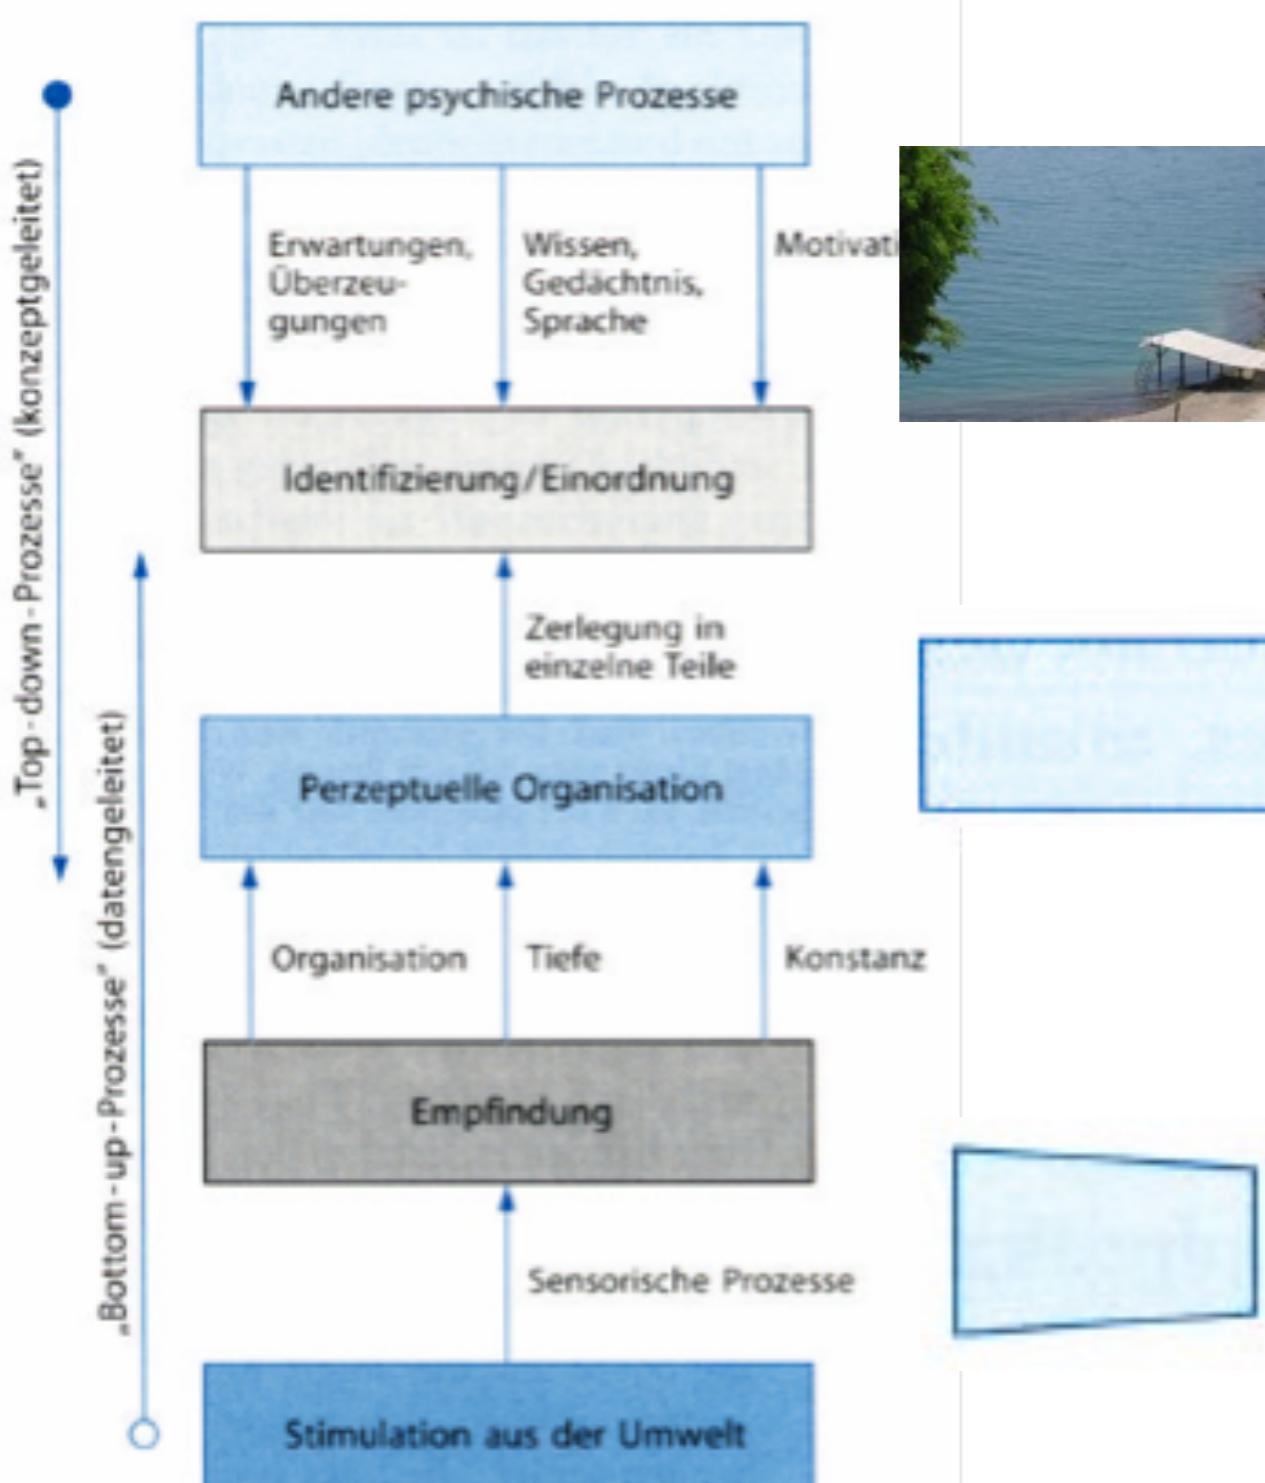

# Knowledge acquisition pipeline

[W. Bradford Paley, SG 2003]

# Human Perception & Attention

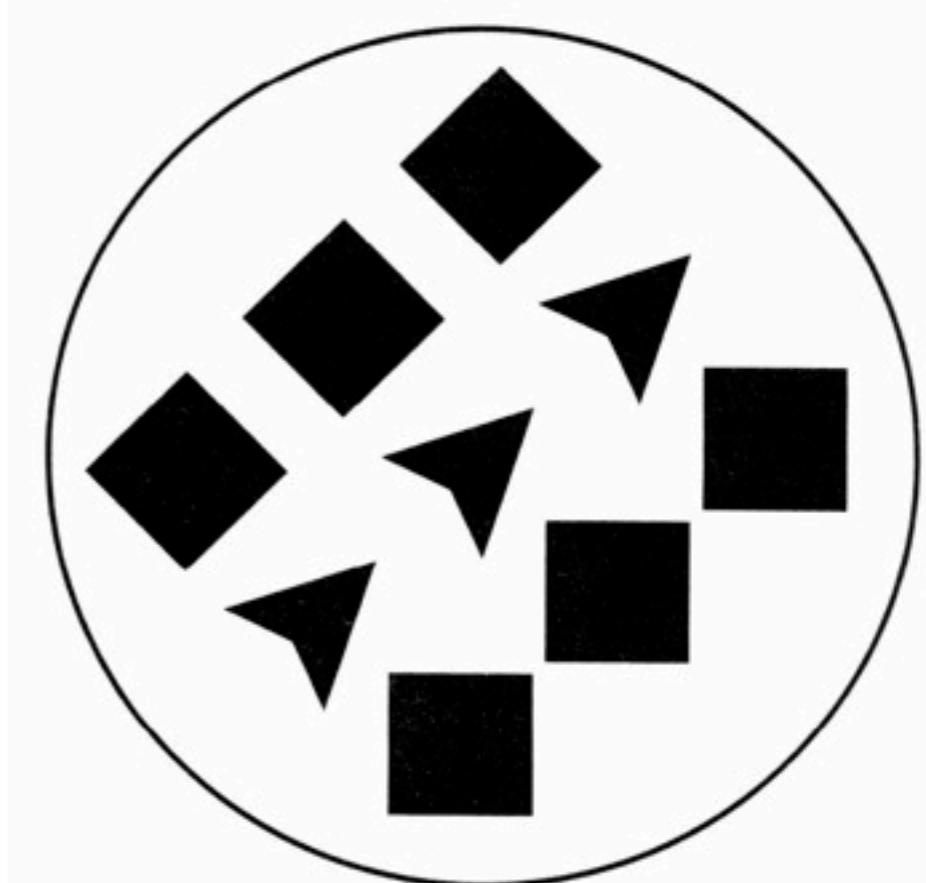

3. Implicit (learned) knowledge is used to form a conceptual representation (meaning). -> Cognitive Psychology

2. Single elements are aggregated to something whole -> Gestalt. No semantic meaning yet. -> Psychophysics

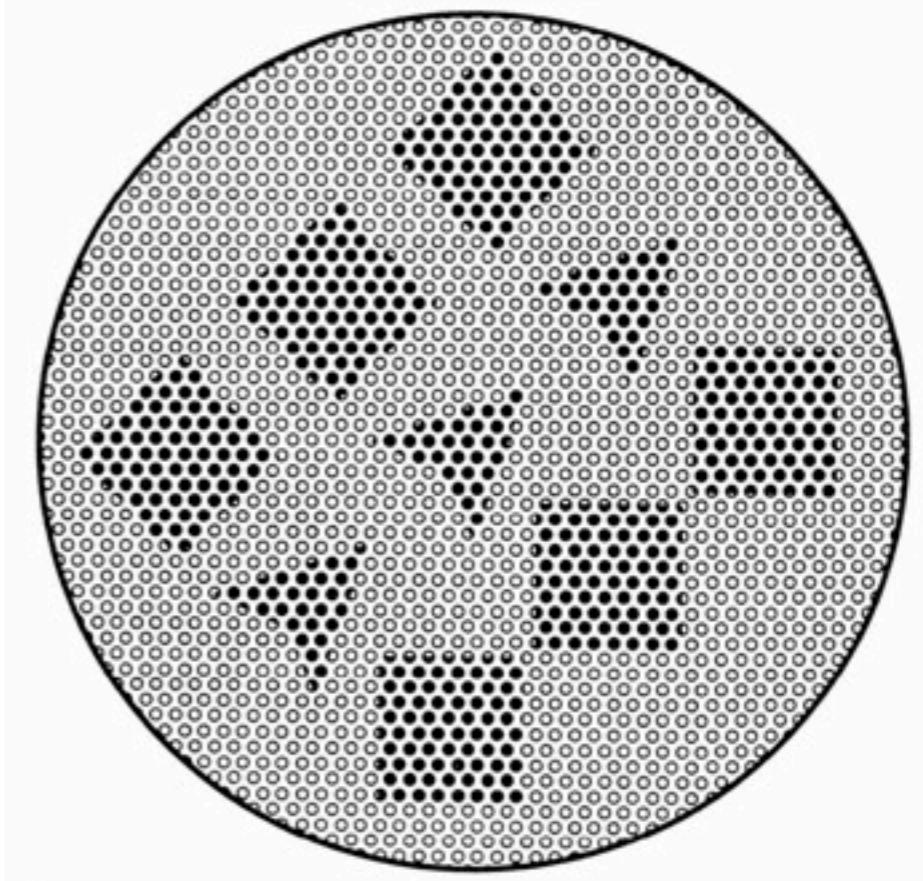

1. Stimuli from the world are being perceived. Edges, points, orientation, position, gradients and color. -> Physiology

# Object Discrimination

- Grouping of objects by identifying strong changes in color (edge detection)
- Grouping by texture properties.

a

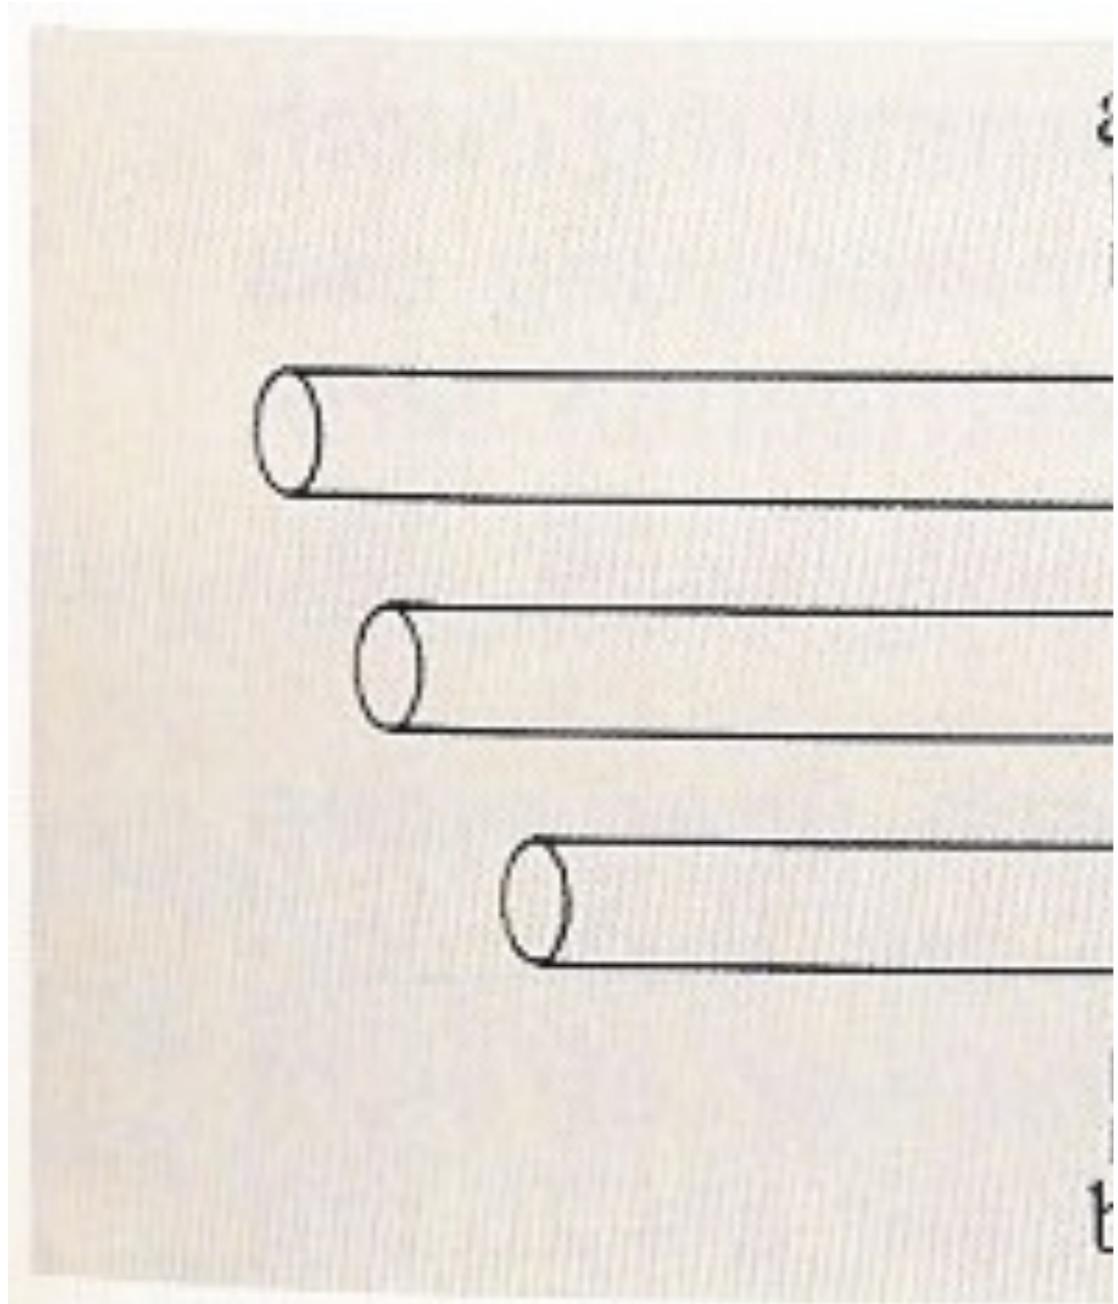

b

# Foreground vs. Background

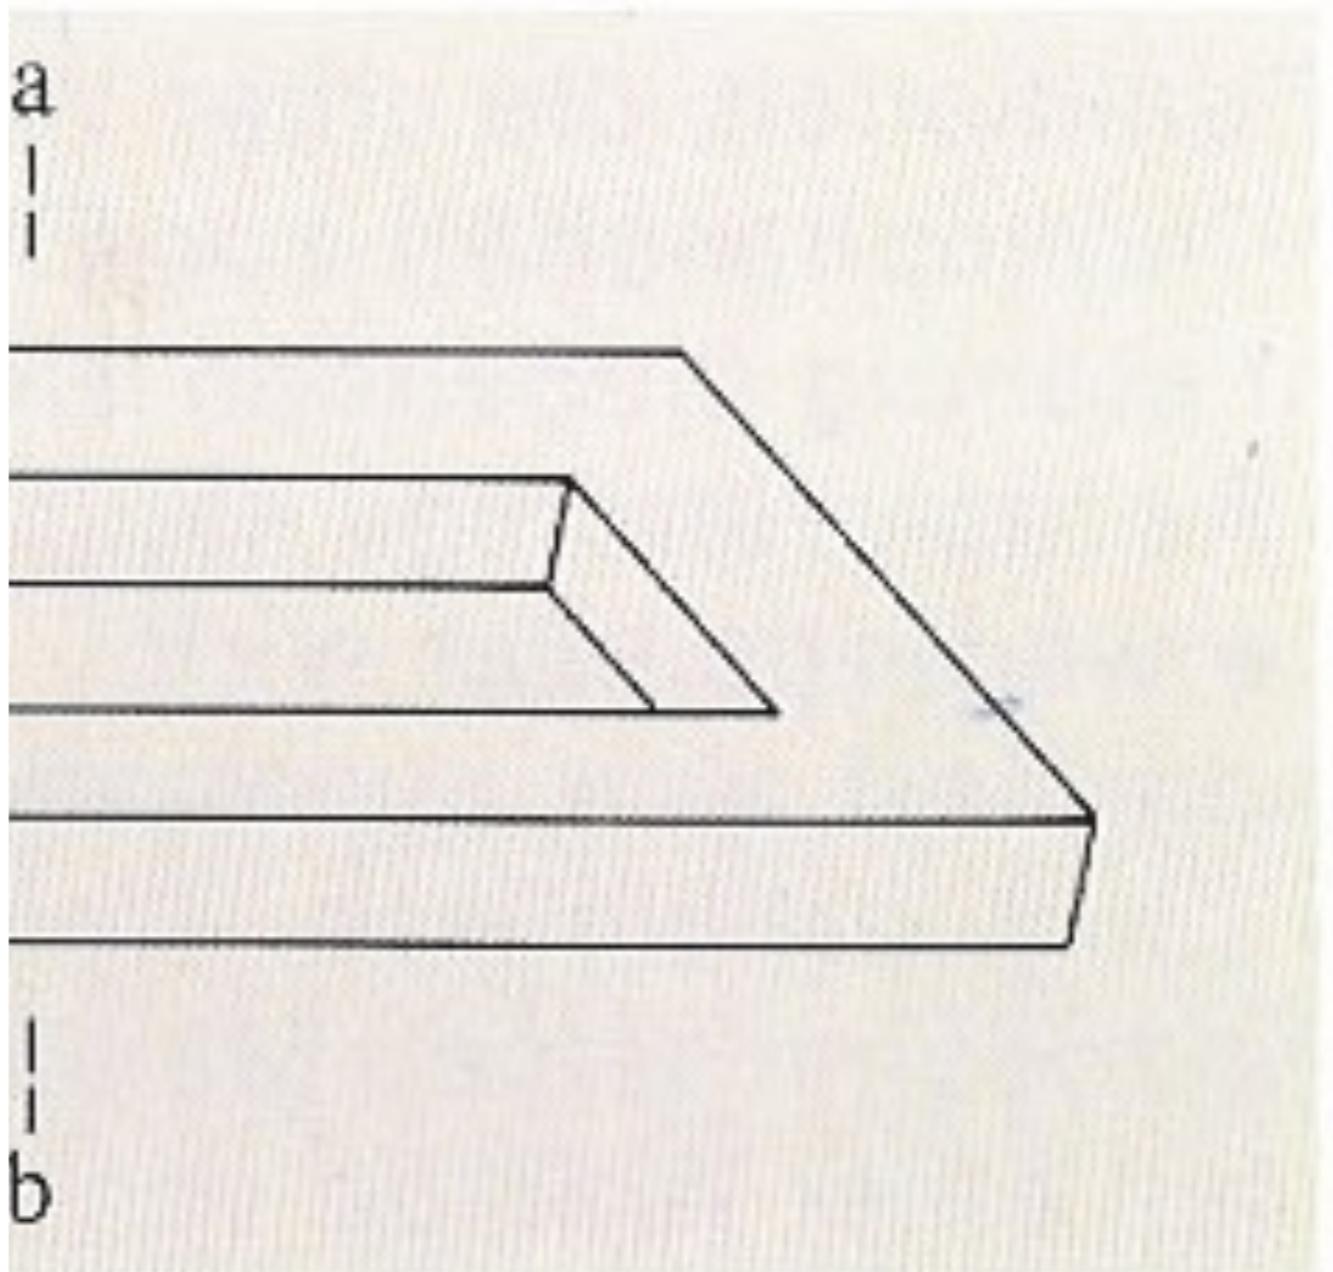

- Interpretation of the found objects in terms of a **figure** (foreground) and a **background**

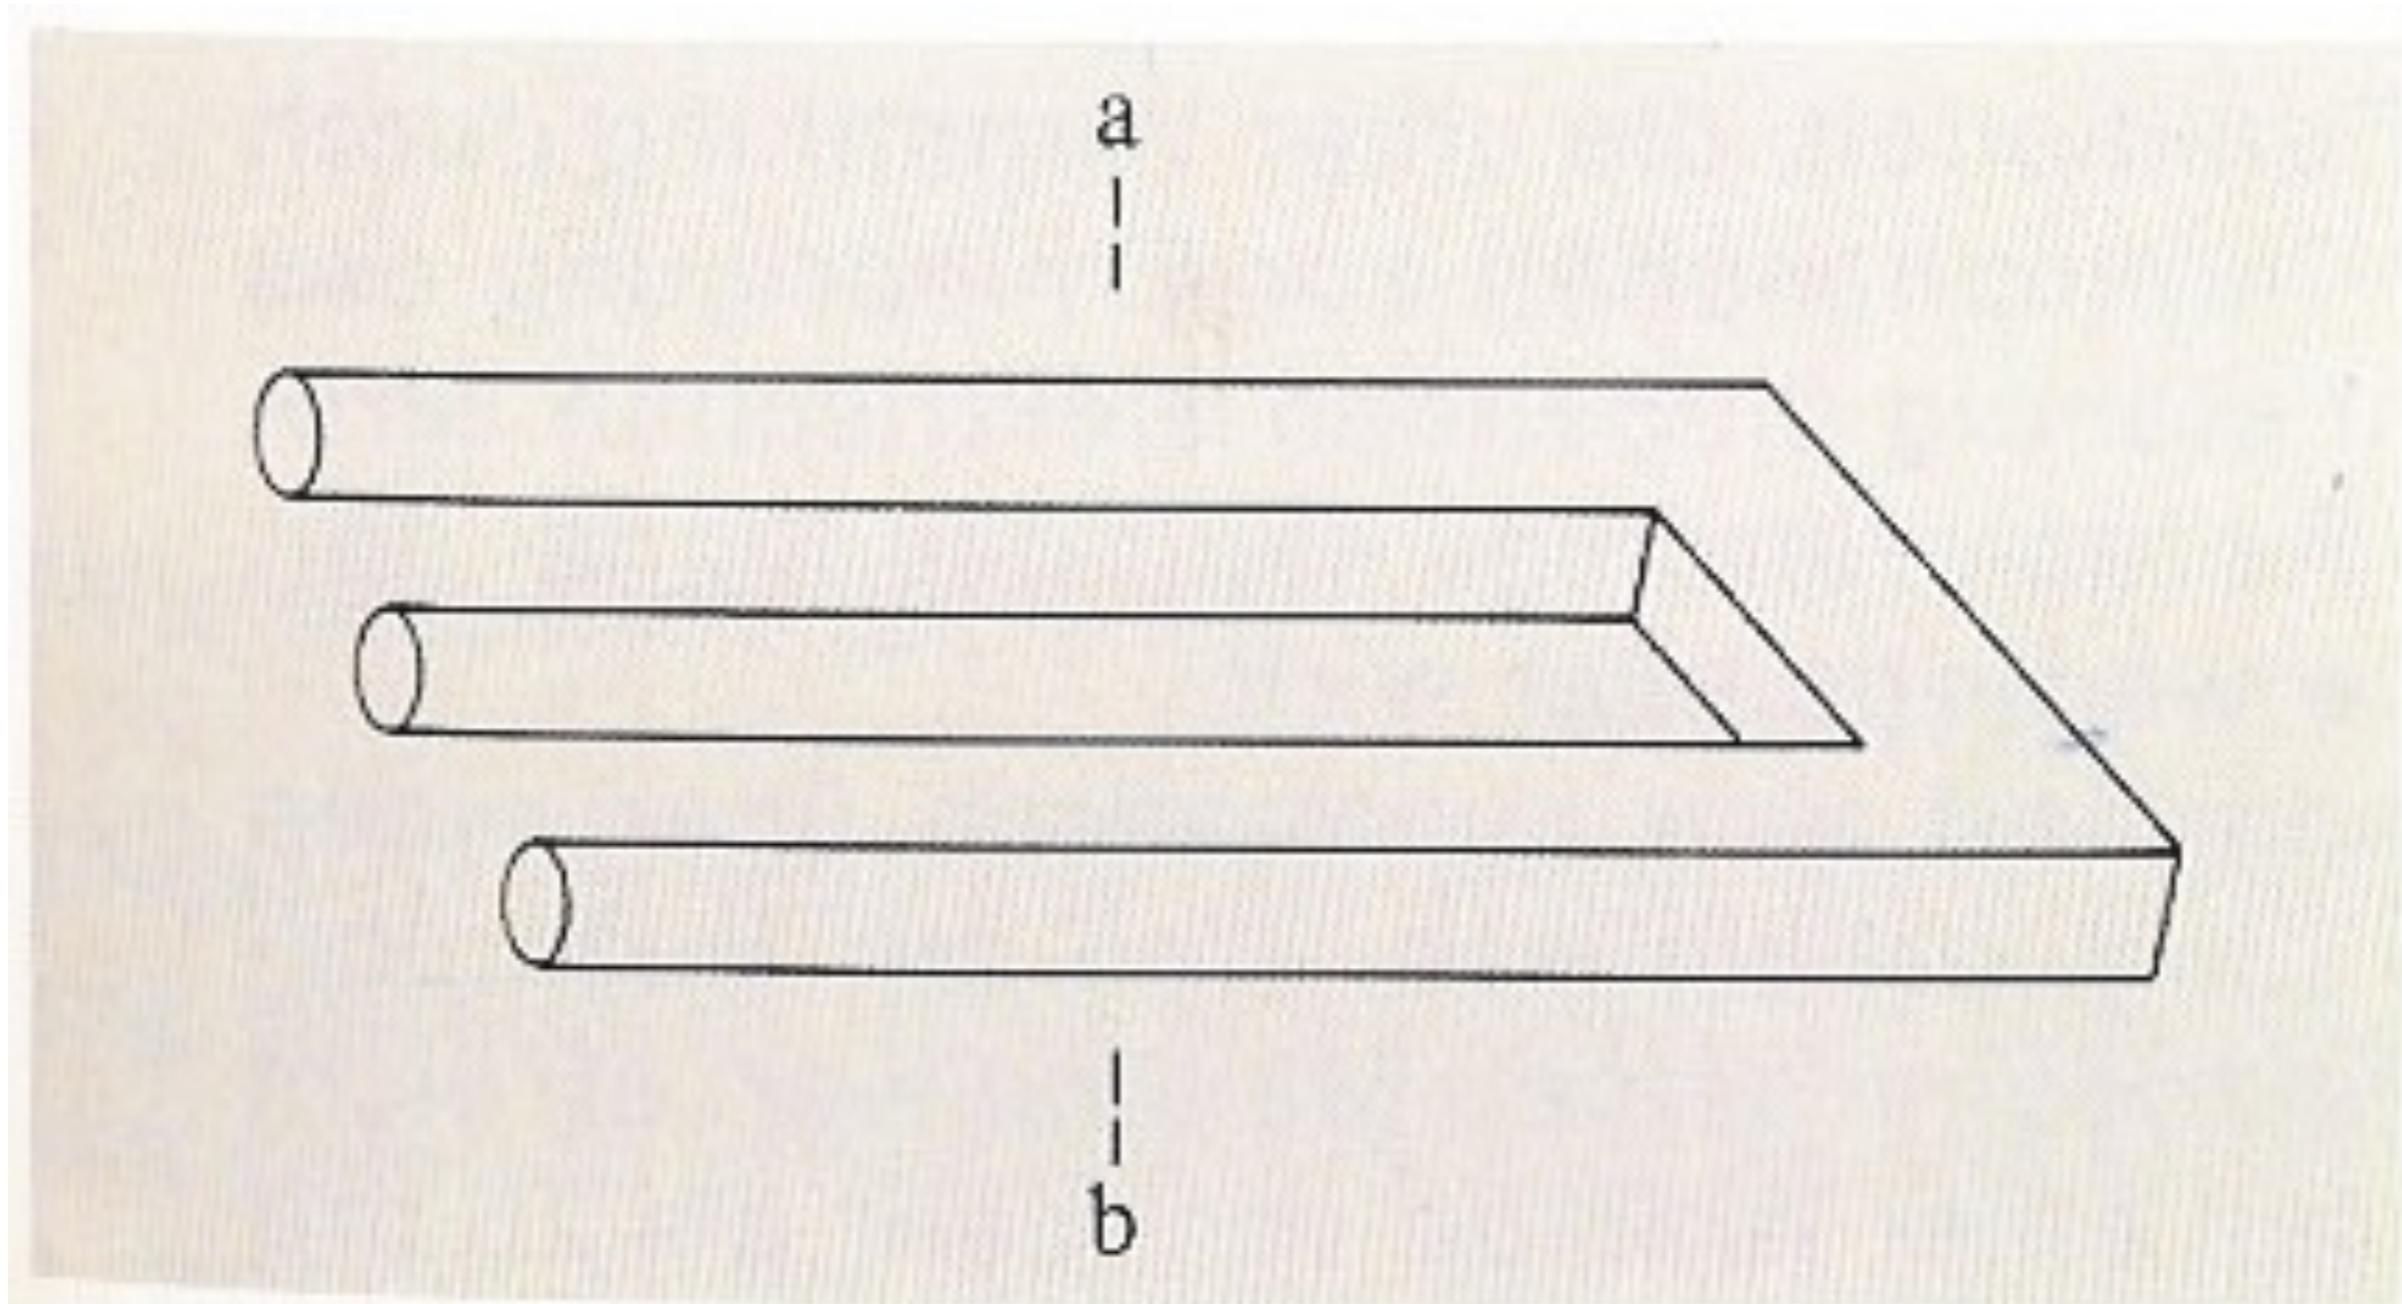

# 2D drawing: Make it conclusive... (1)

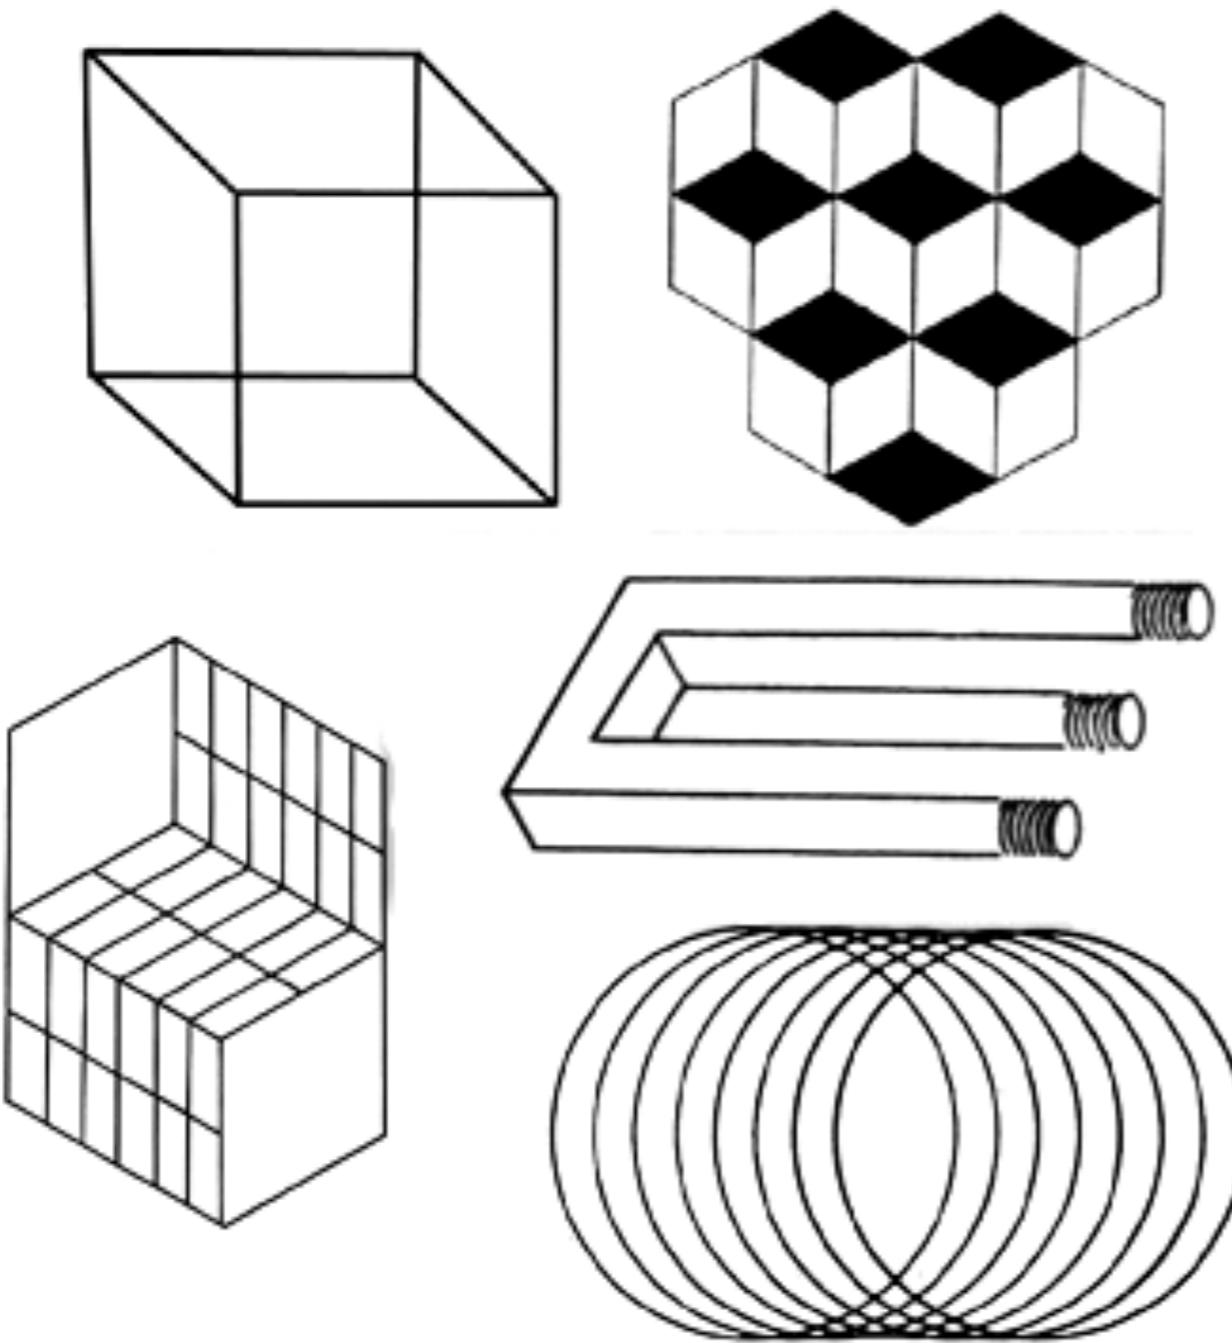

## 2D drawing: Make it conclusive... (2)

## 2D drawing: Make it conclusive... (3)

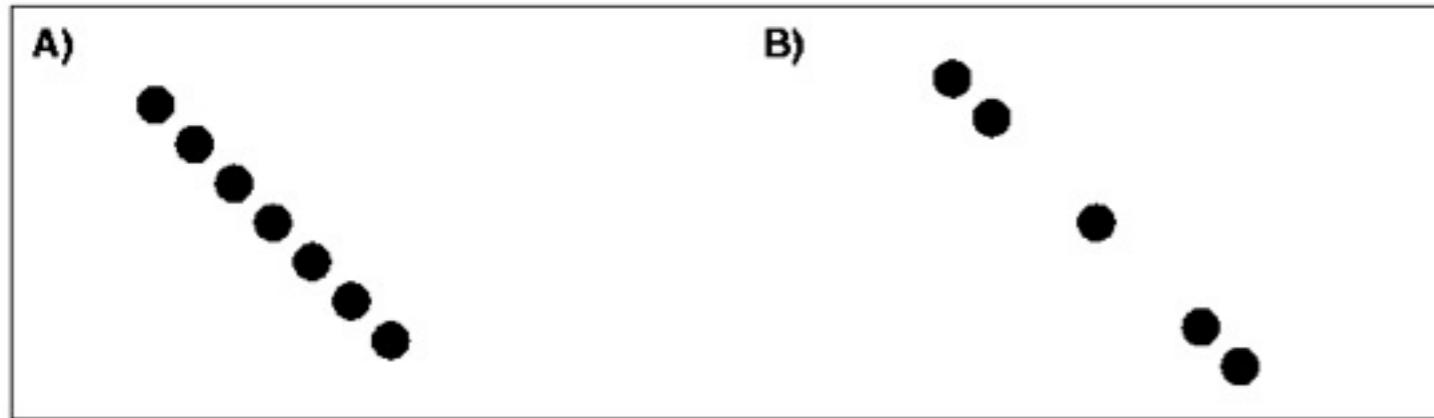

From A. Maelicke, Vom Reiz der Sinne, VCH 1990

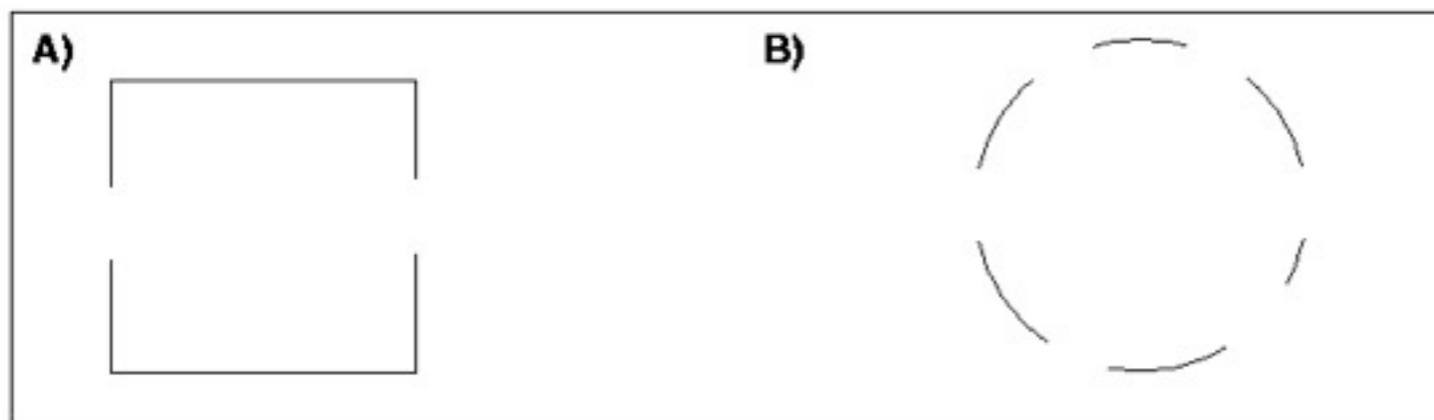

# Gestalt Laws

- The perception of the whole is more than the sum of its elements
- The laws are not strictly defined and describe different classes of observations
- Not just valid for visual but more general for all cognitive processes

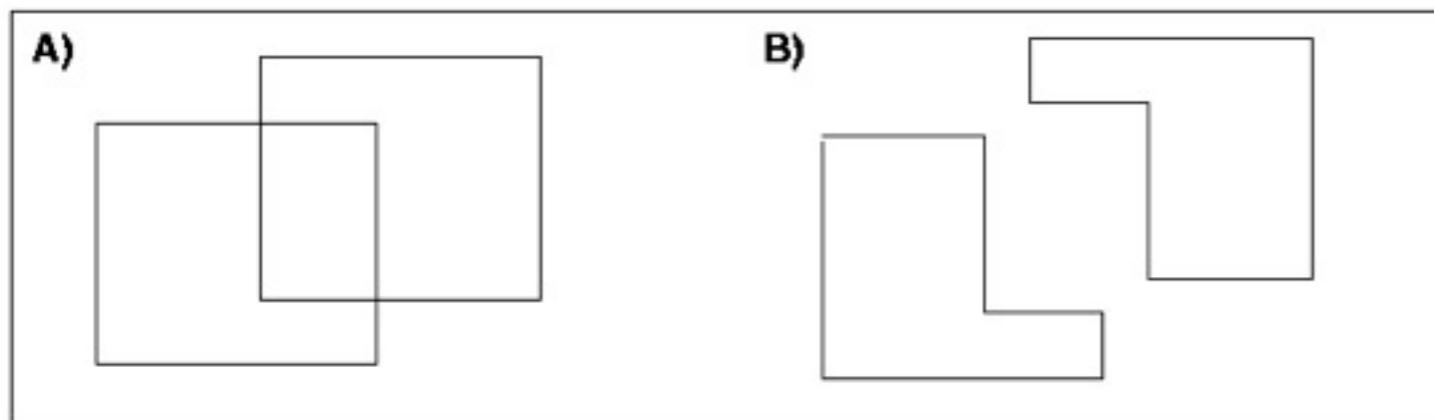

# Some Gestalt Laws

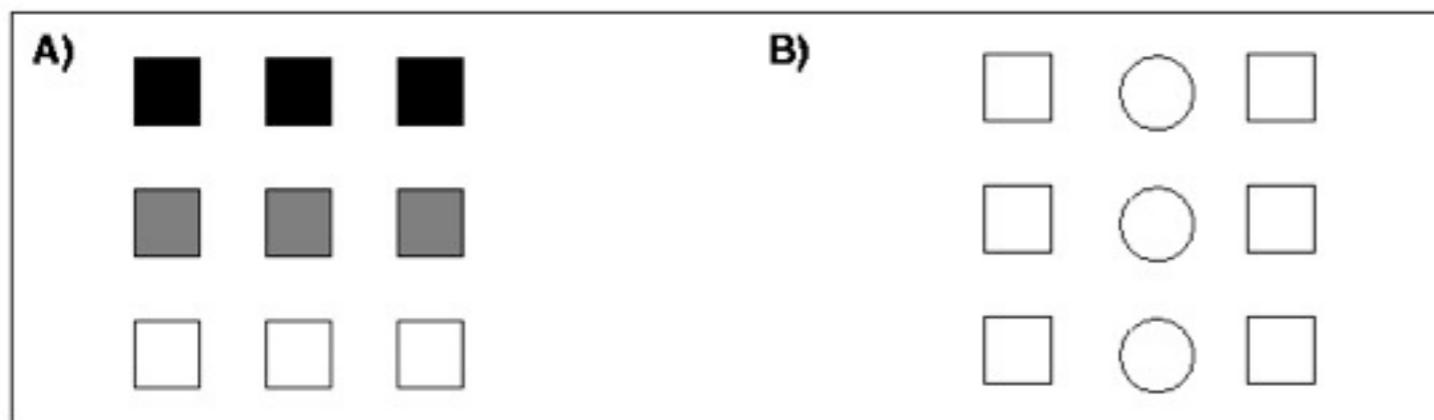

Gesetz der Nähe

Gesetz der Kontinuität

Prägnanzgesetz

Ähnlichkeitsgesetz

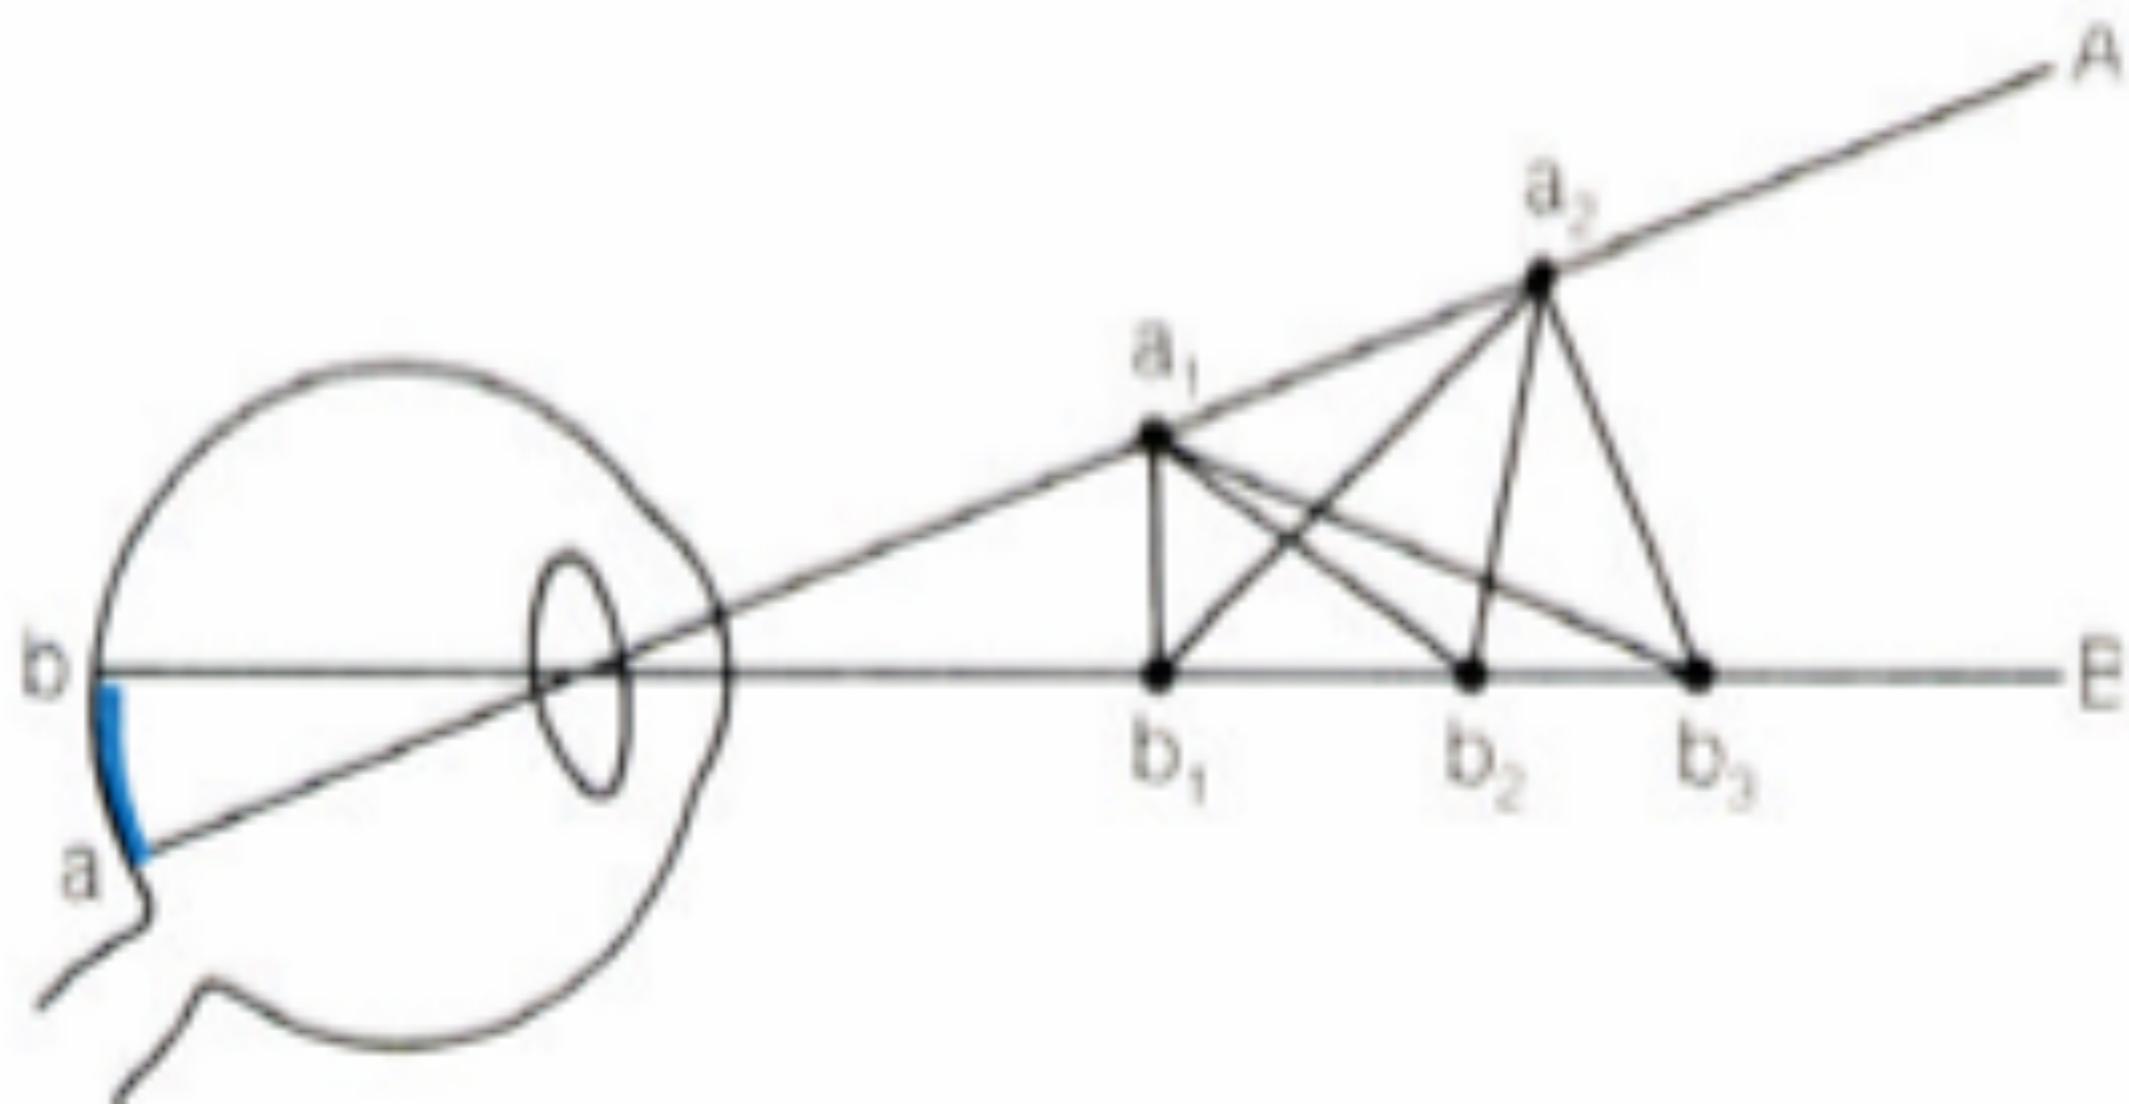

# Gestalt Perception Example

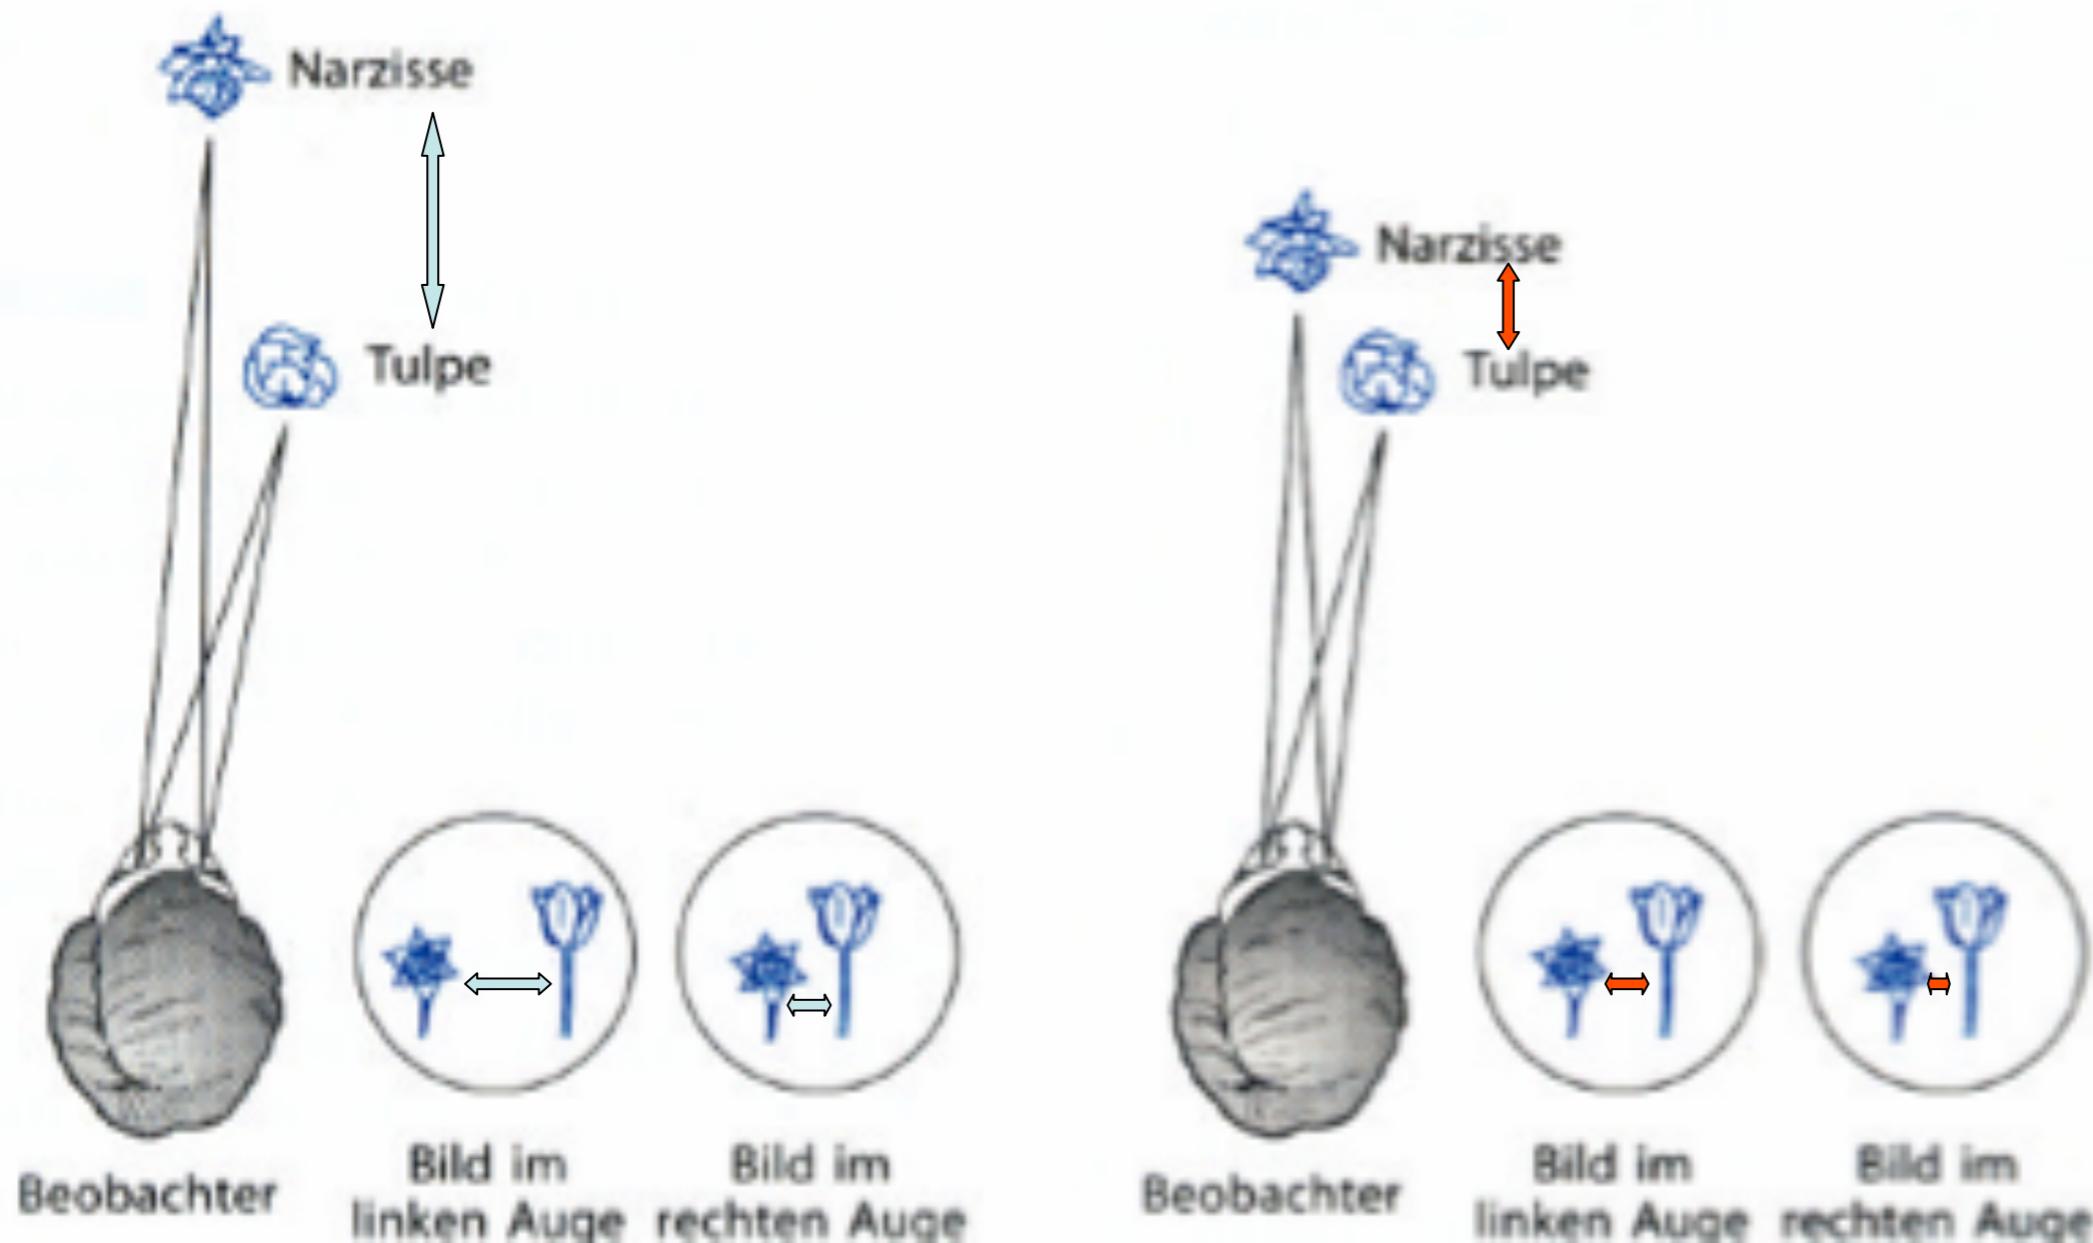

# Depth perception

- Ambiguities in depth perception prevent distance judgment with one eye

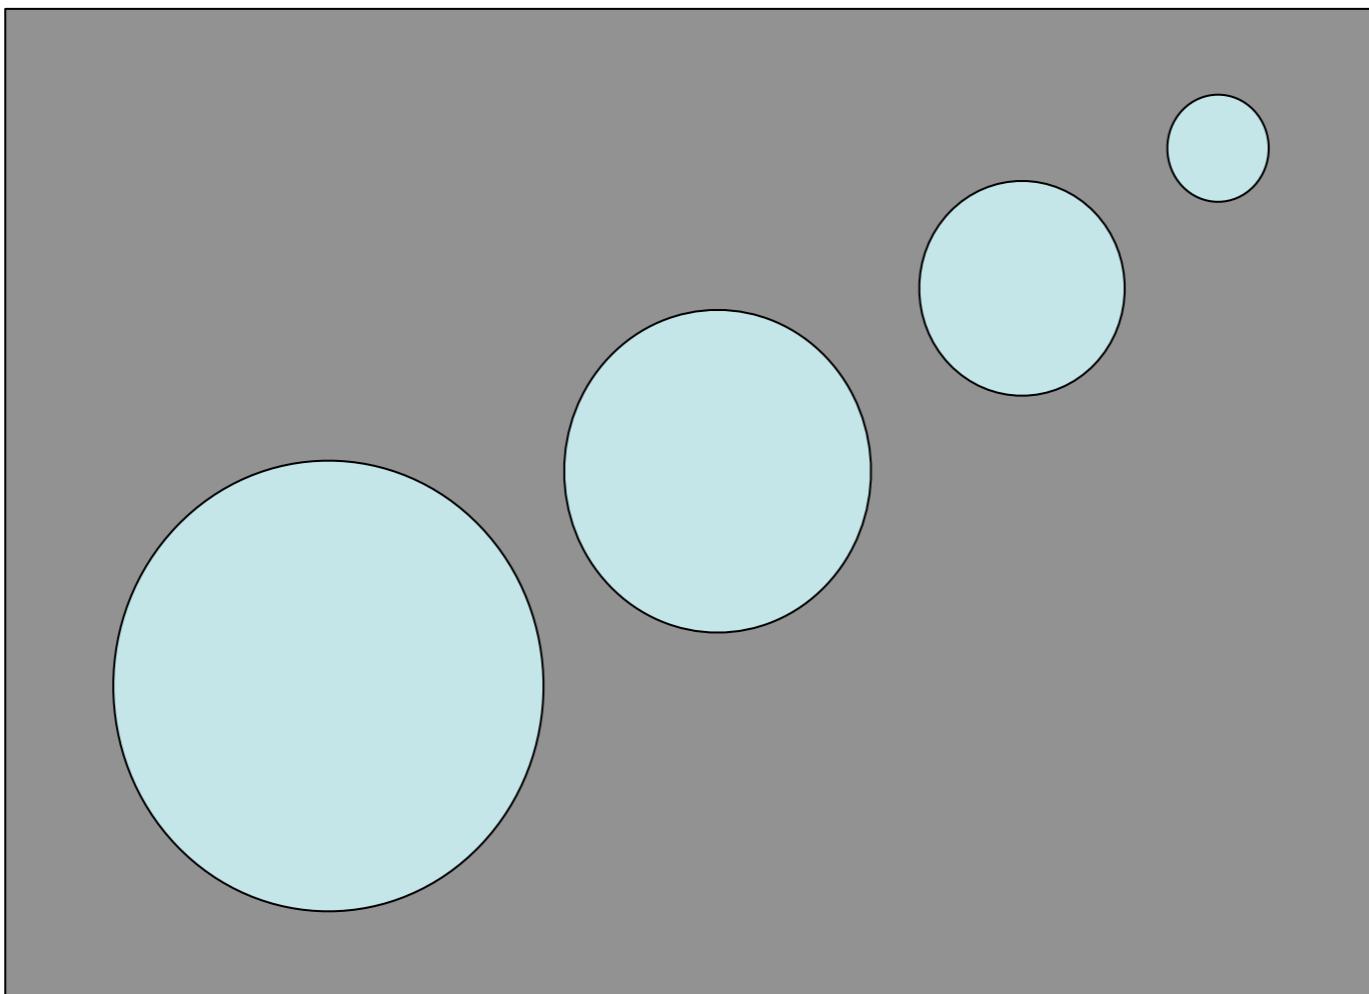

# Depth perception II

- Works only for distances up to 3m

# Monocular depth judgment

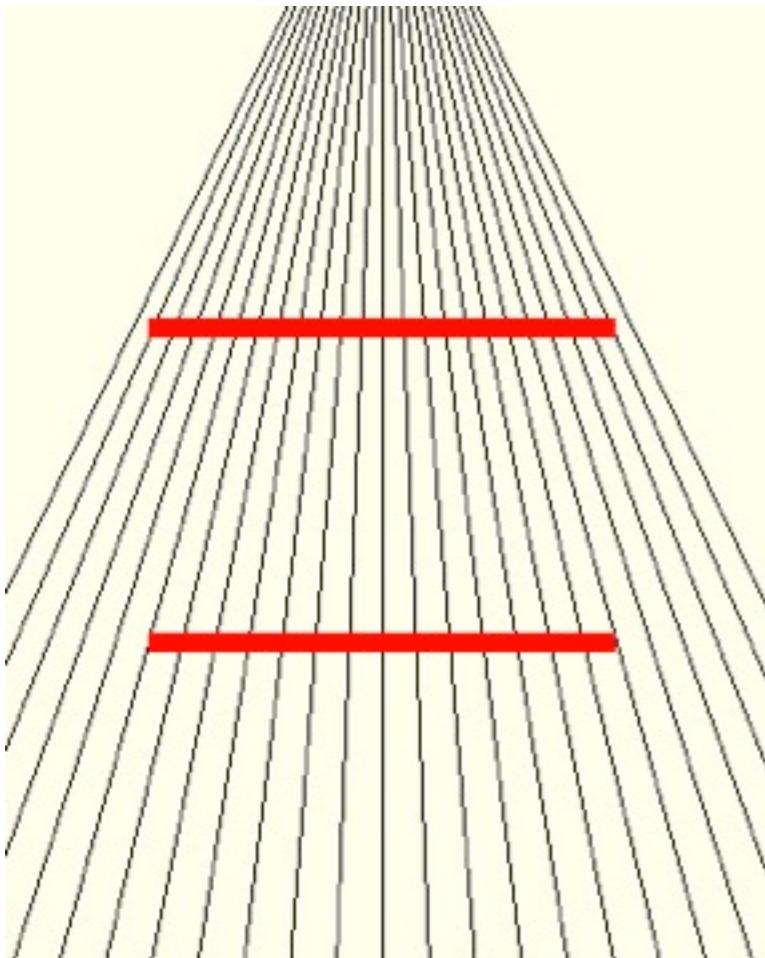

- Relative size:

The smaller, the further away

# Linear perspective

- Converging lines signal depth (see also Ponzo Illusion).

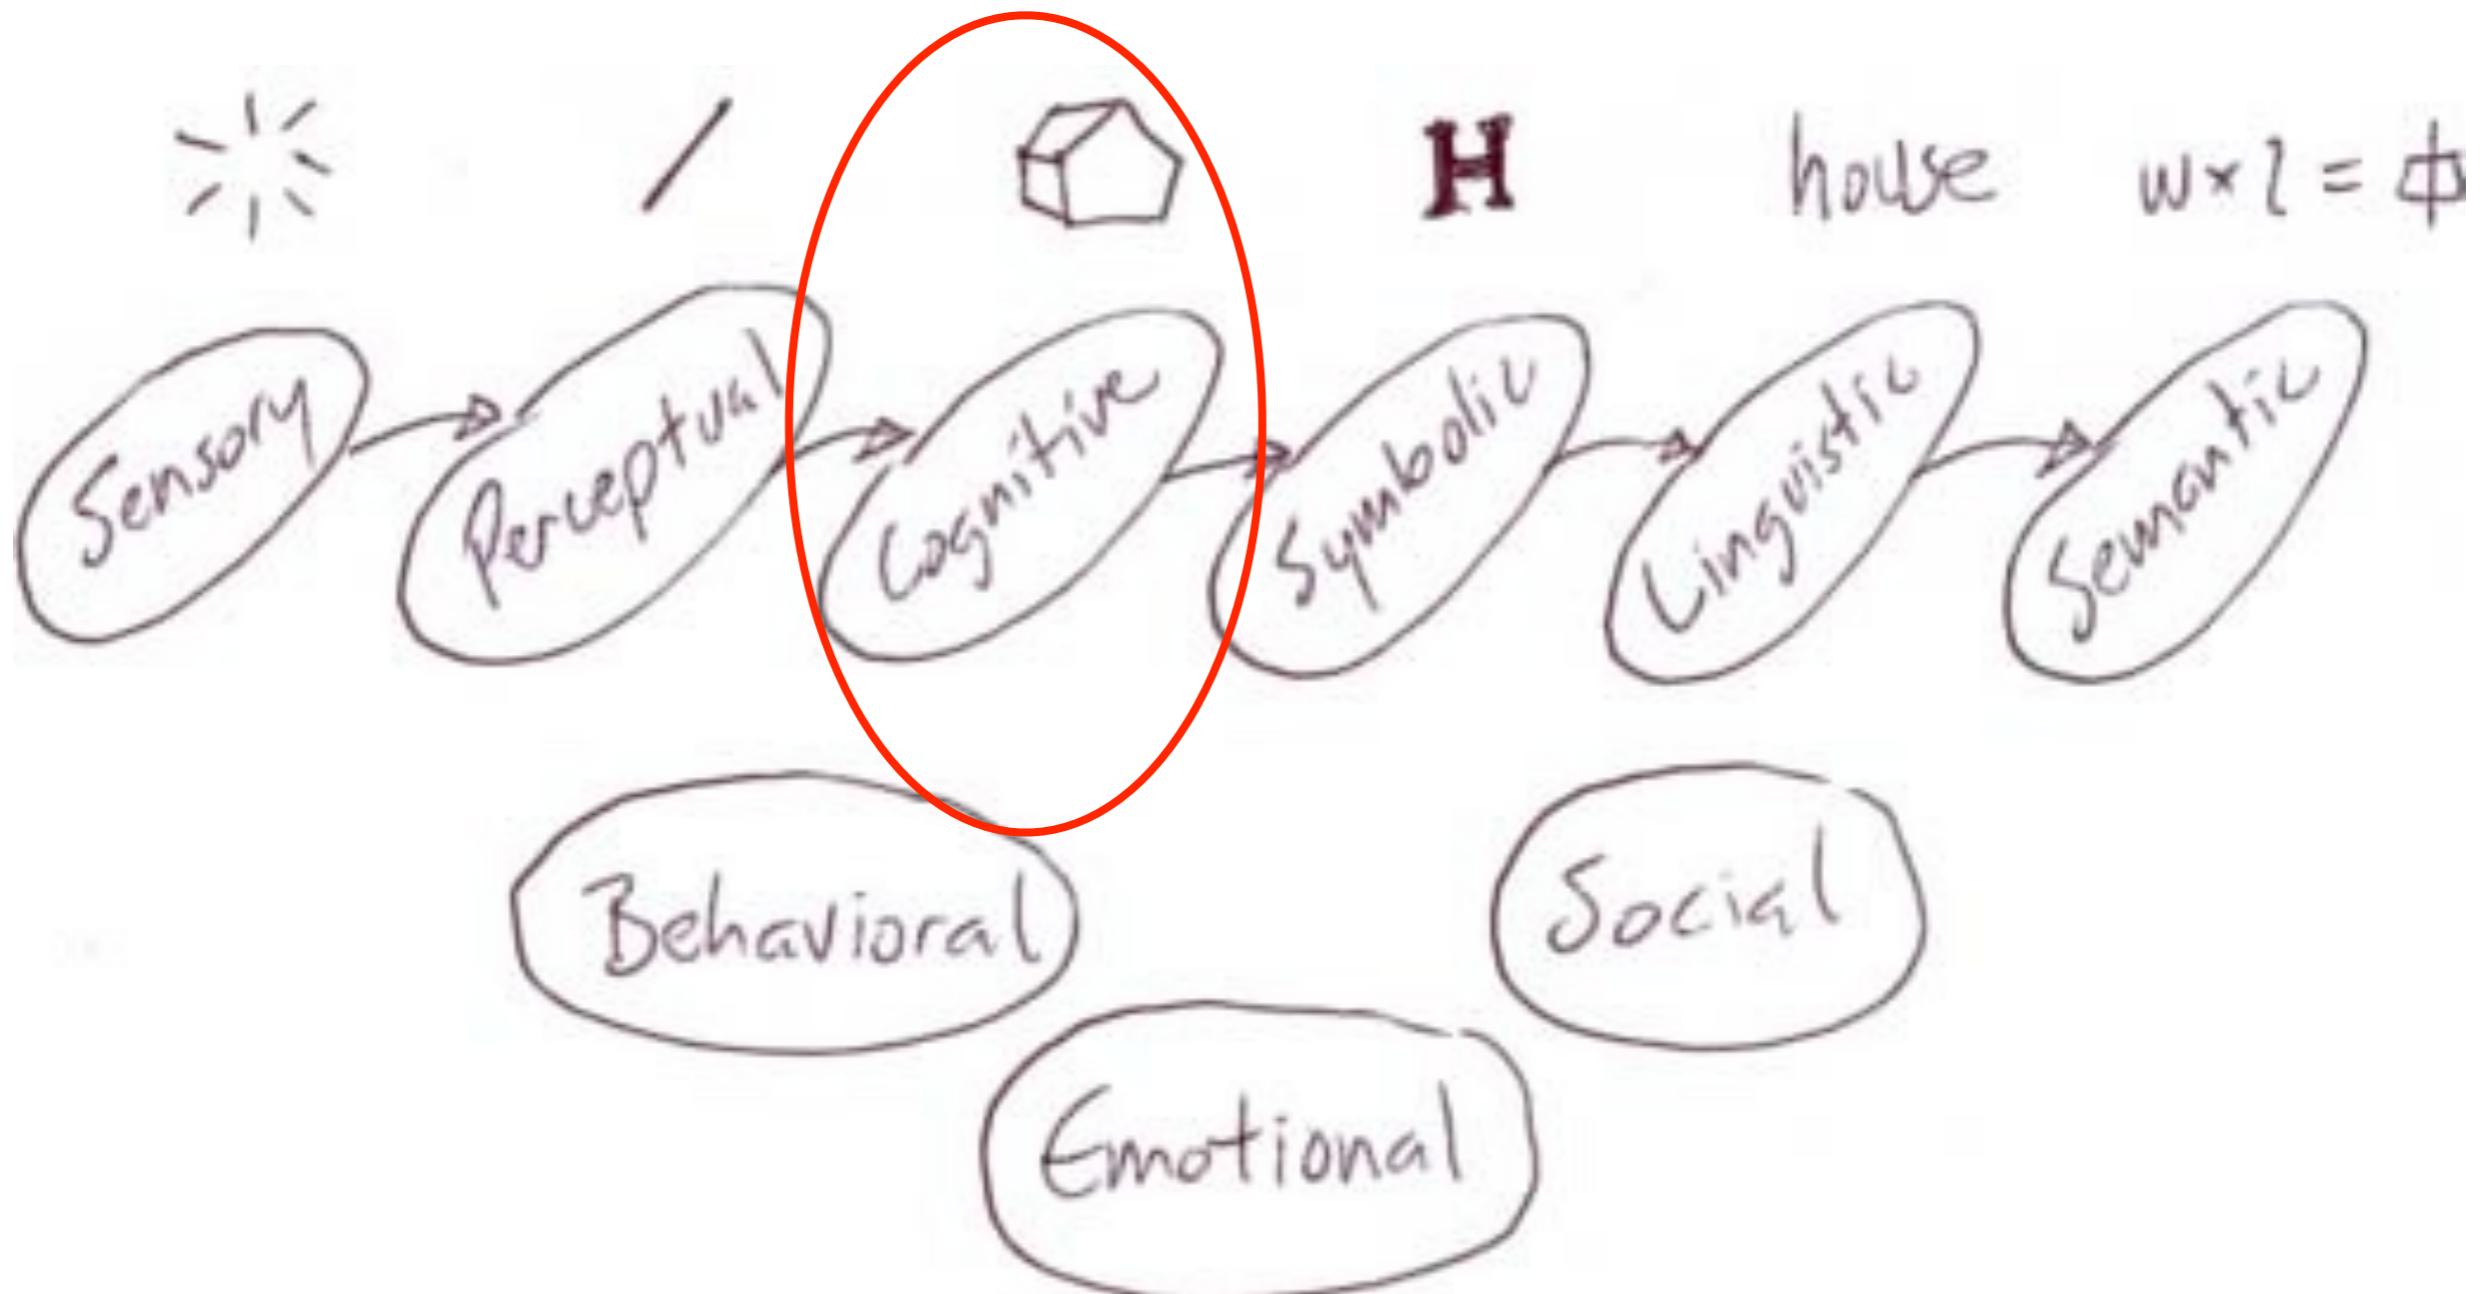

# Texture Gradient

- Diminishing granularity signals depth

# Knowledge acquisition pipeline

[W. Bradford Paley, SG 2003]

# Geons (Biederman et al, 1991)

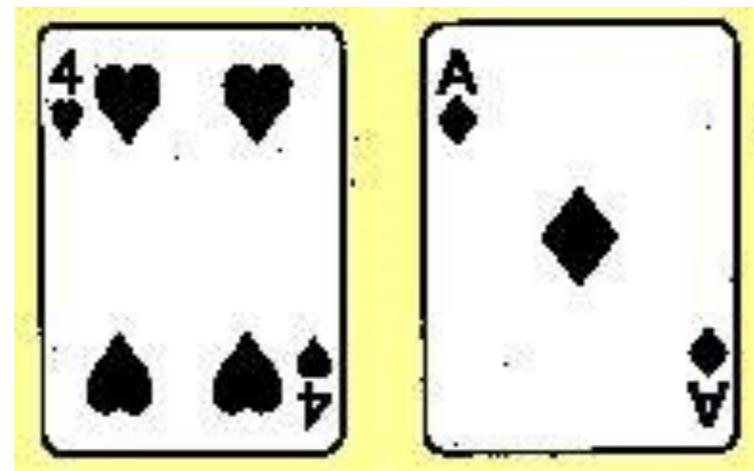

- All geometric objects can be decomposed into 36 „Geons“
- Every Geon leaves a unique pattern on the retina -> Bottom-Up part.
- Knowledge about Objects in the world helps constituting these from single geons -> Top-Down part.

# Geons (Biederman et al, 1991)

# Knowledge and Perception

- Influence of Knowledge
  - unusual colors slow down identification.

# Attention – Cocktail Party Phenomenon

- Cocktail party – Part 1:
  - Lots of people
  - Noisy chatting everywhere
  - You're engaged in conversation
- How can we follow our own conversation – but not get distracted by others?  
→ Attention is selective

# Attention – Cocktail Party Phenomenon

- Cocktailparty – Part 2:
    - Suddenly you hear your name from the surrounding noise. Even if everything else was blocked out before.
  - How can we perceive blocked Information?
  - Perception buffers.
- Different theories for selective Attention.

# Change Blindness [Ronald A. Rensink, 1998]

- Large changes in a scene are not noticed
- ...when there is a short distraction, e.g.
  - “mud splashes”
  - “brief flicker”
  - “cover box”

<http://nivea.psycho.univ-paris5.fr/ECS/ECS-CB.html>

- One possible conclusion: no complete visual buffer
  - Instead: directed attention to smaller area

# CB: Flicker Example 1

# CB: Flicker Example 2

# CB: Gradual Change

# Knowledge acquisition pipeline

[W. Bradford Paley, SG 2003]

# Interpretation of symbols

- Associate the recognized object or shape with a meaning (symbolic)

- Characters
- Symbols

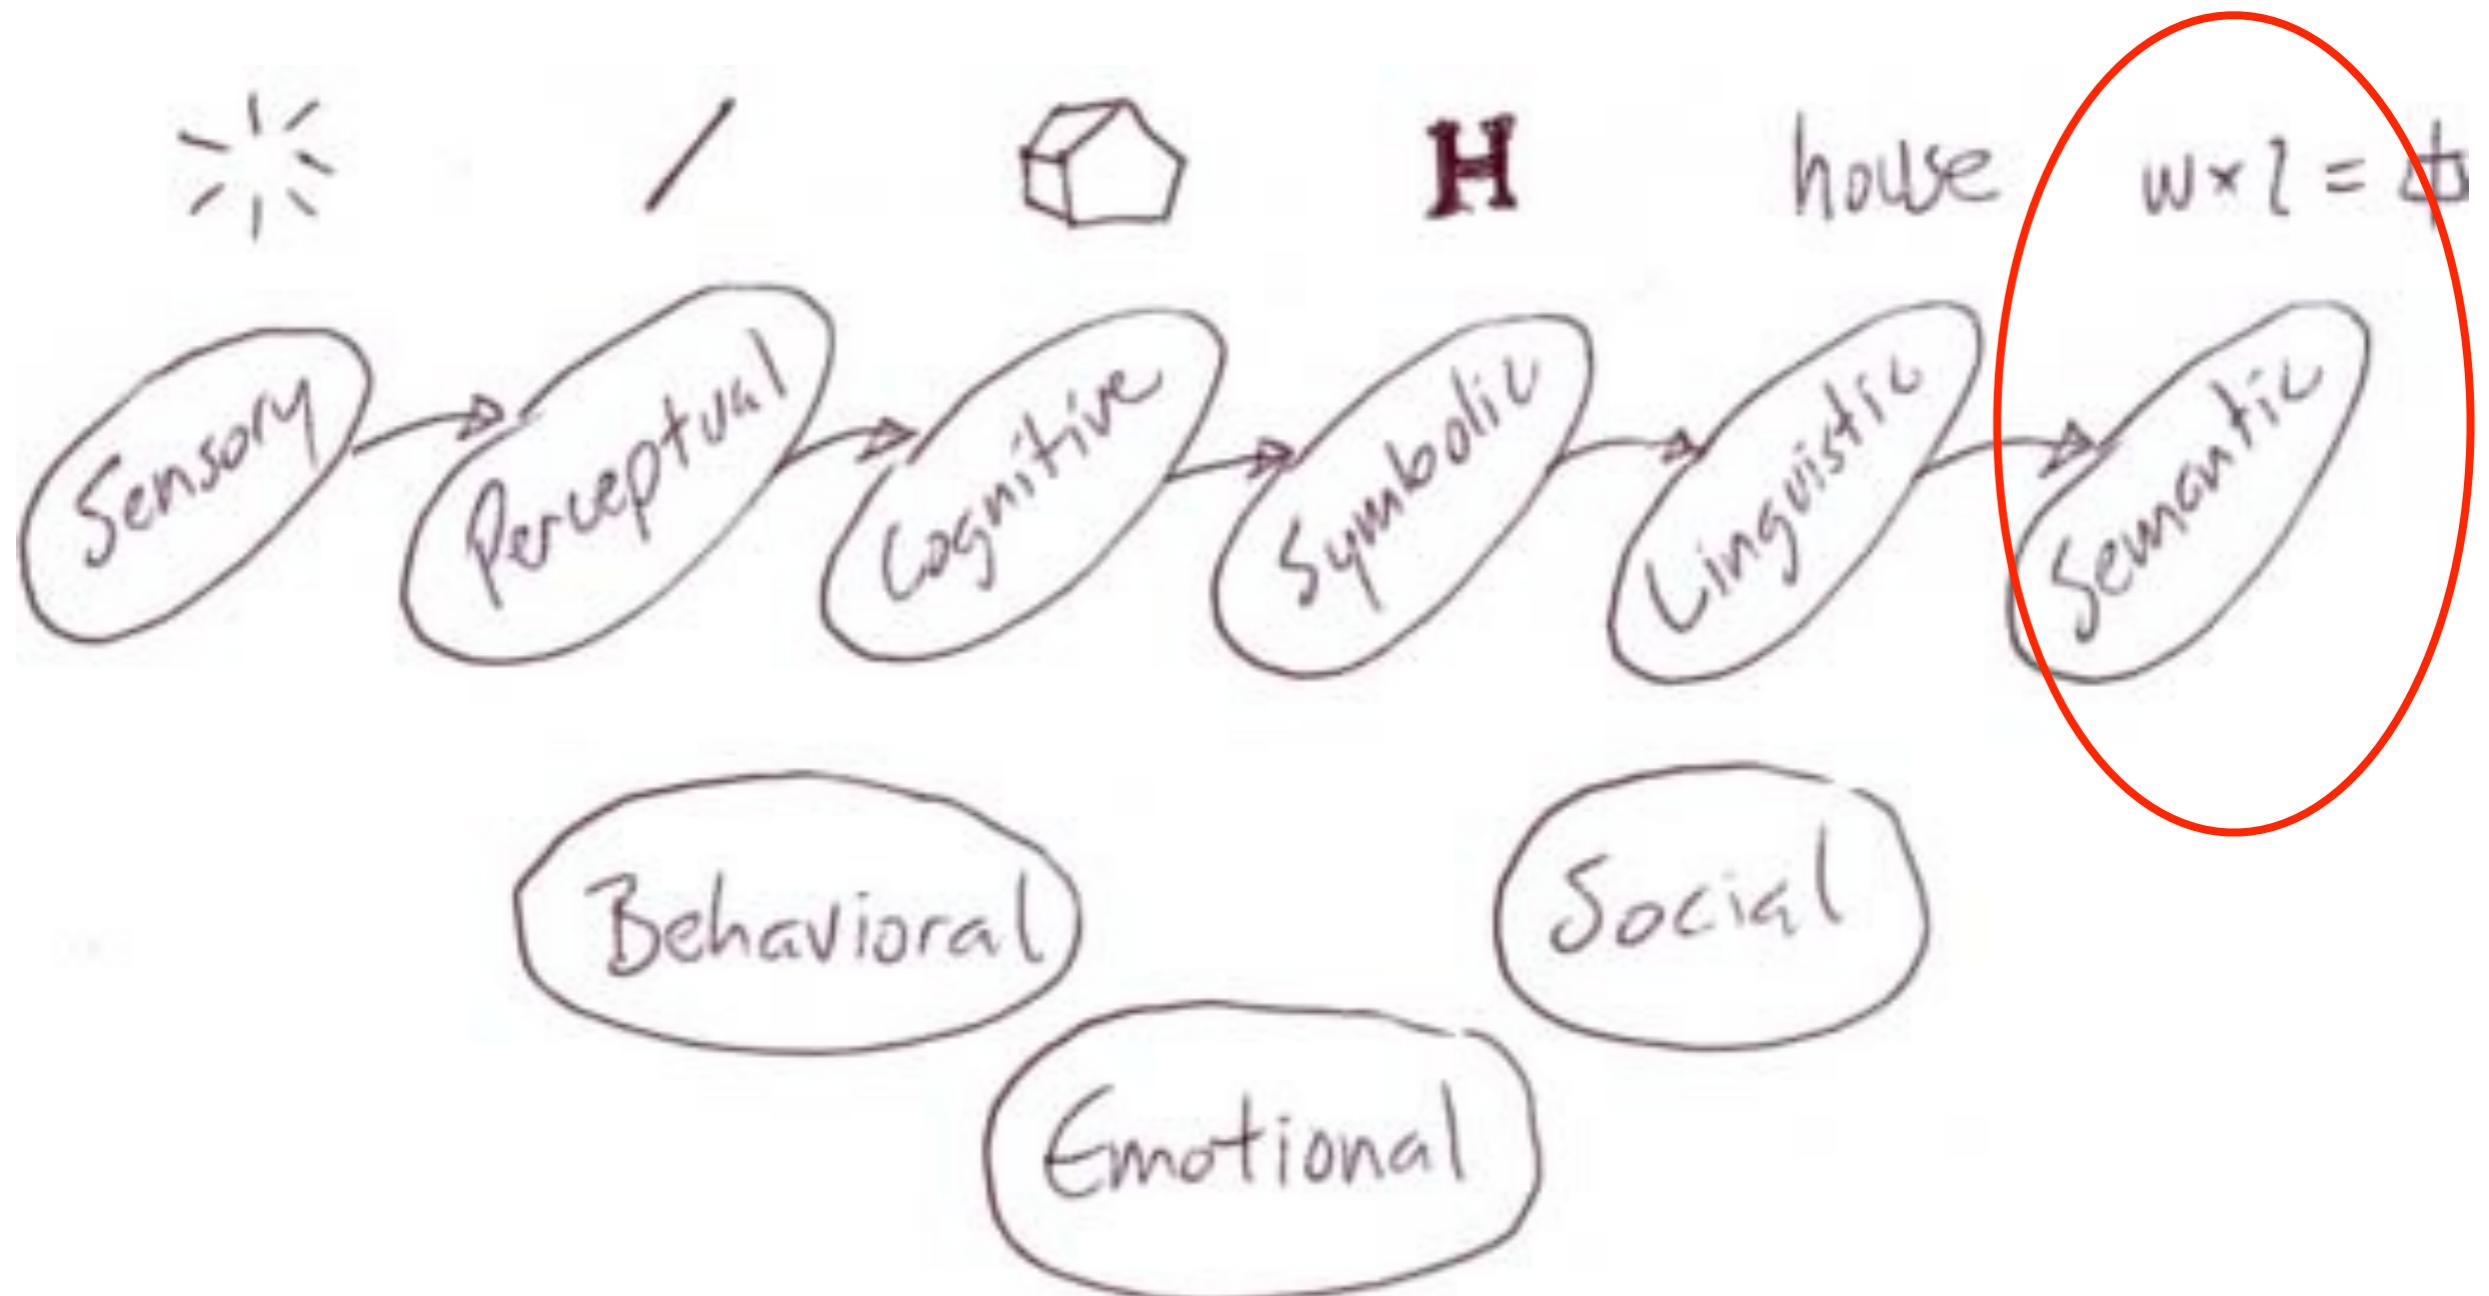

- Can also be combined to a language (linguistic)

- Words from characters
- Different traffic signs from same base elements

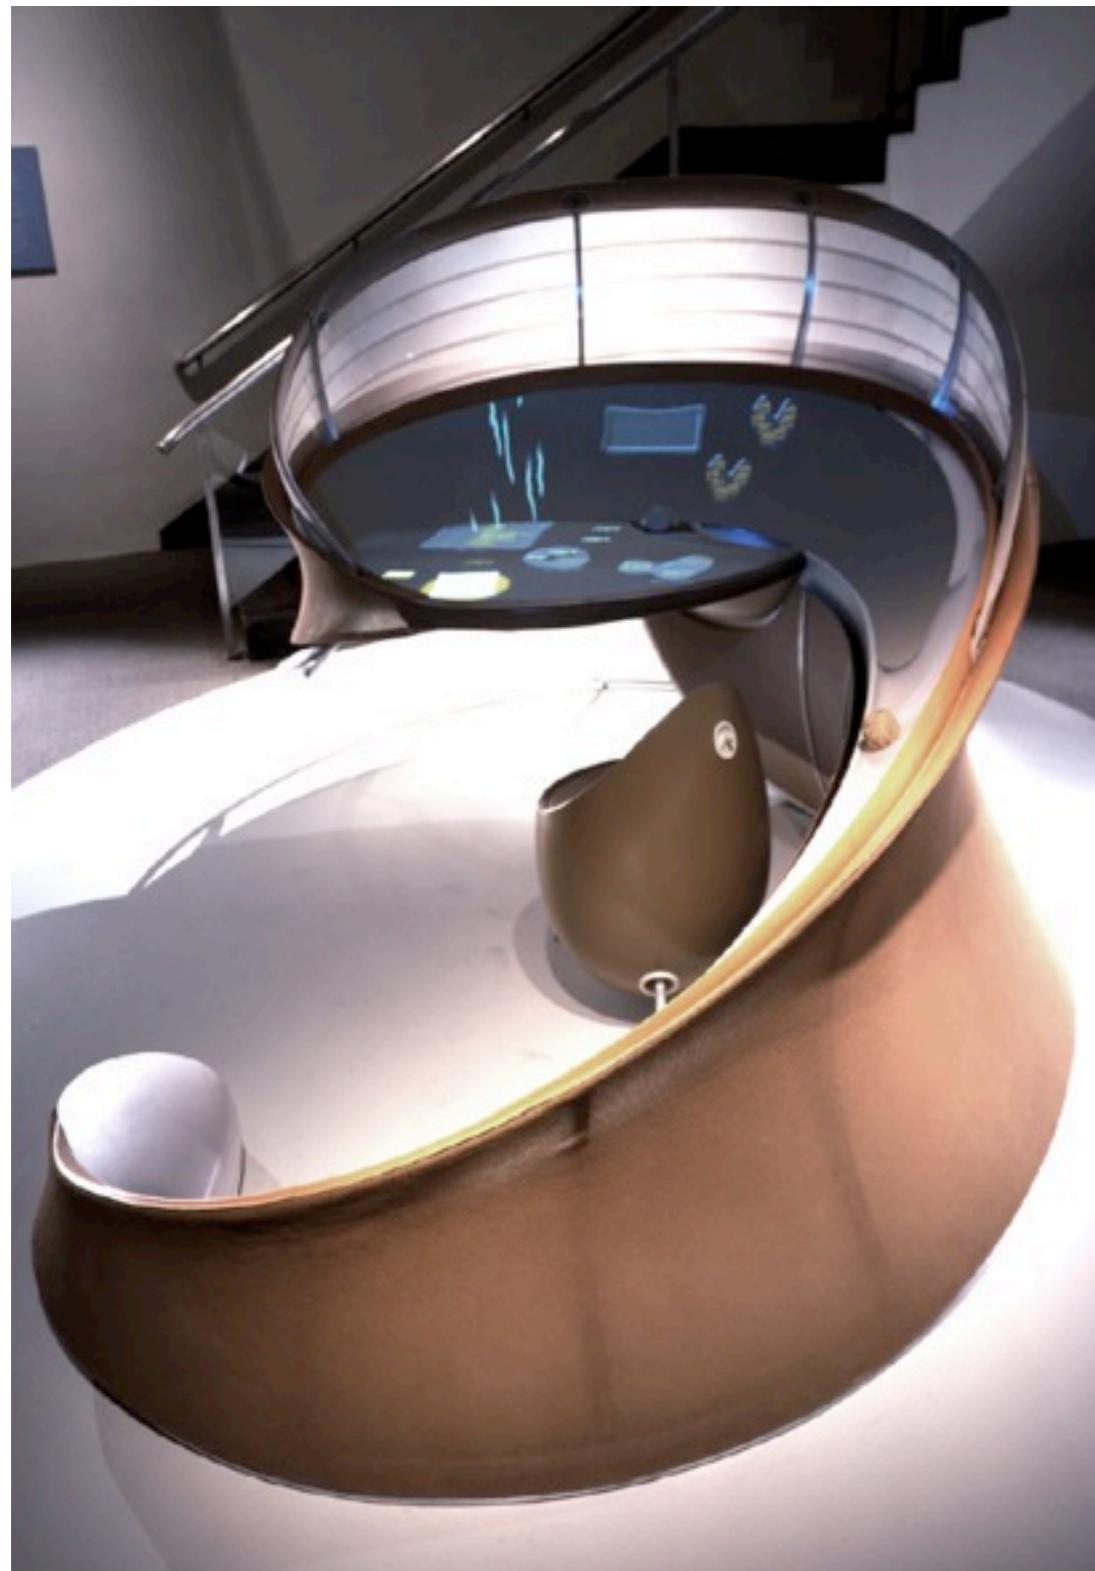

# Knowledge acquisition pipeline

[W. Bradford Paley, SG 2003]

# MindSpace

(Brad Paley, <http://www.didi.com/brad/>)

- Interaktive Visualisierung einer Hierarchie
- Verschiedene synchronisierte Darstellungen
- Gruppenbildung durch aneinanderrücken von Objekten
- Spielerisches Ordnen und Klassifizieren
