

Praktikum Entwicklung Mediensysteme

Implementing a User Interface

Outline

- Introduction
- Programmatic vs. XML Layout
- Common Layout Objects
- Hooking into a Screen Element
- Listening for UI Notifications
- Applying a Theme to Your Application

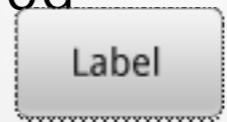

Introduction

Implementing a User Interface

Introduction

- Activity
 - Basic functional unit of an Android application
 - But by itself, it does not have any presence on the screen
- Views and Viewgroups
 - Basic units of user interface expression on the Android platform

Beautiful View from up here...

- android.view.View
 - Stores layout and content for a specific rectangular area of the screen
 - Handles measuring and layout, drawing, focus change, scrolling, and key/gestures
 - Base class for widgets
 - Text
 - EditText 
 - InputMethod
 - MovementMethod
 - Button 
 - RadioButton 
 - Checkbox 
 - ScrollView

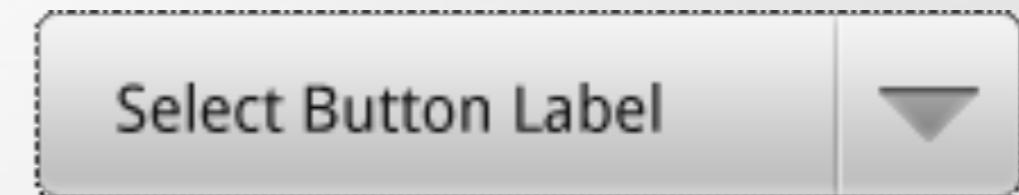

```
package com.android.hello;

import android.app.Activity;
import android.os.Bundle;
import android.widget.TextView;

public class HelloAndroid extends Activity {
    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle icicle) {
        super.onCreate(icicle);
        TextView tv = new TextView(this);
        tv.setText("Hello, Android");
        setContentView(tv);
    }
}
```

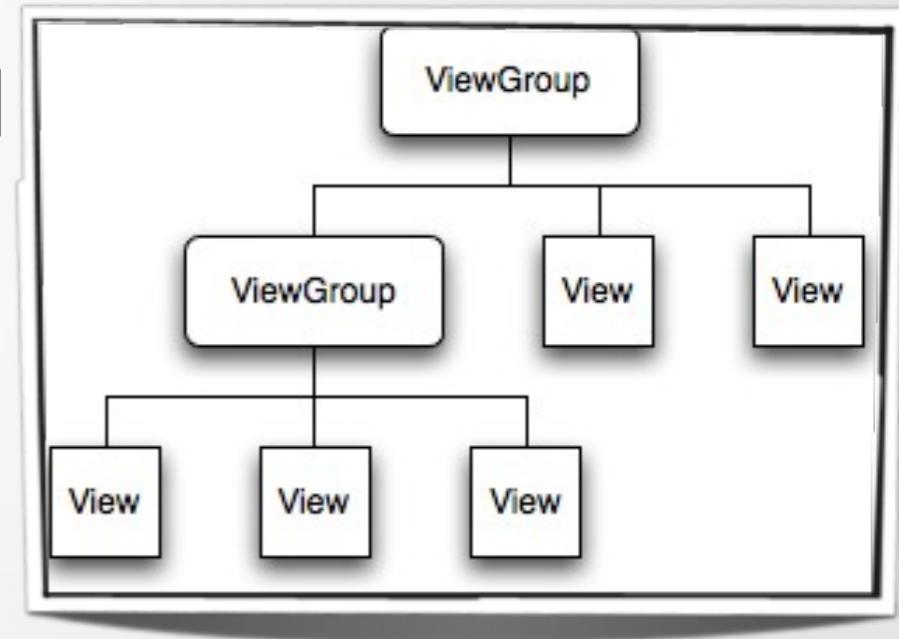

Viewgroups

- android.view.Viewgroup
 - Contains and manages a subordinate set of views and other viewgroups
 - Base class for layouts

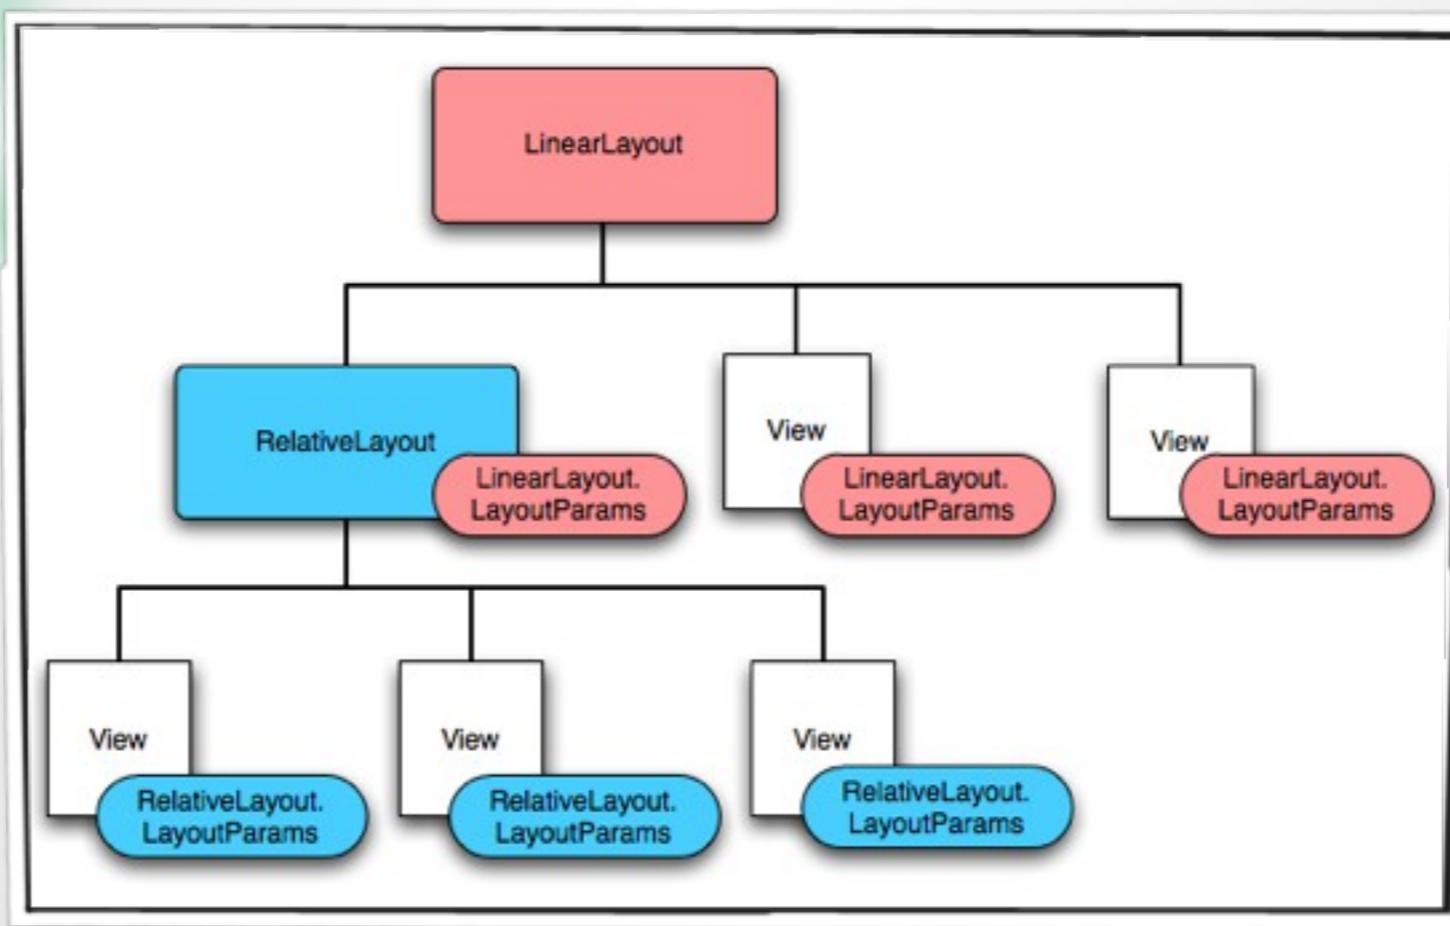

Tree-Structured UI

- An Activity in Android
 - Defined using a tree of view and viewgroup nodes
- setContentView() method
 - Called by the Activity to attach the tree to the screen for rendering

LayoutParams

- Every viewgroup class uses a nested class that extends ViewGroup.LayoutParams
 - Contains property types that defines the child's size and position

Creating Layouts

Implementing a User Interface

Programmatic UI Layout

- Programmatic UI Layout
 - Constructing and building the applications UI directly from source code
 - Disadvantage
 - small changes in layout can have a big effect on the source code

```
package com.android.hello;

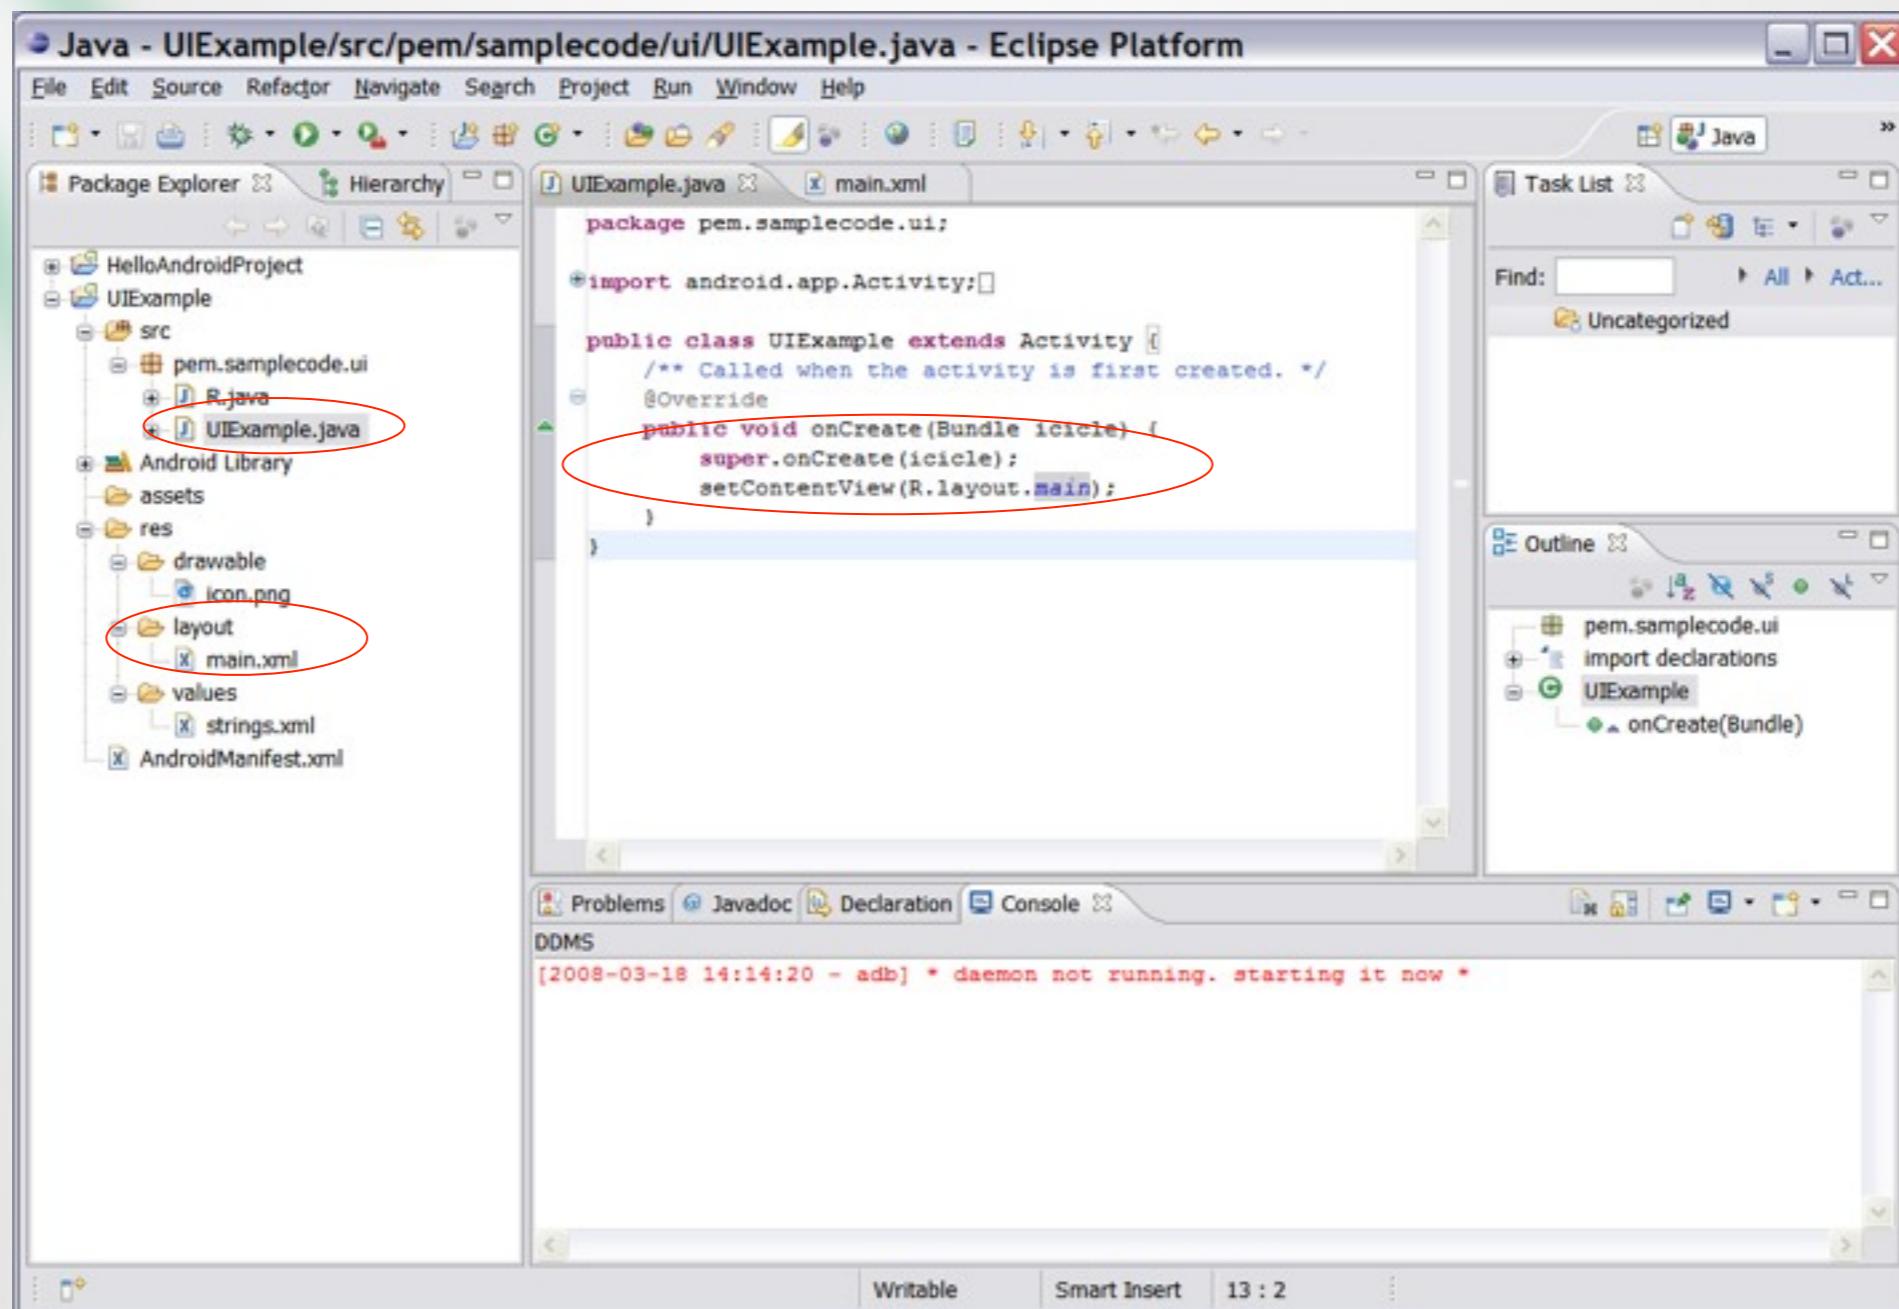

import android.app.Activity;
import android.os.Bundle;
import android.widget.TextView;

public class HelloAndroid extends Activity {
    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle icicle) {
        super.onCreate(icicle);
        TextView tv = new TextView(this);
        tv.setText("Hello, Android");
        setContentView(tv);
    }
}
```

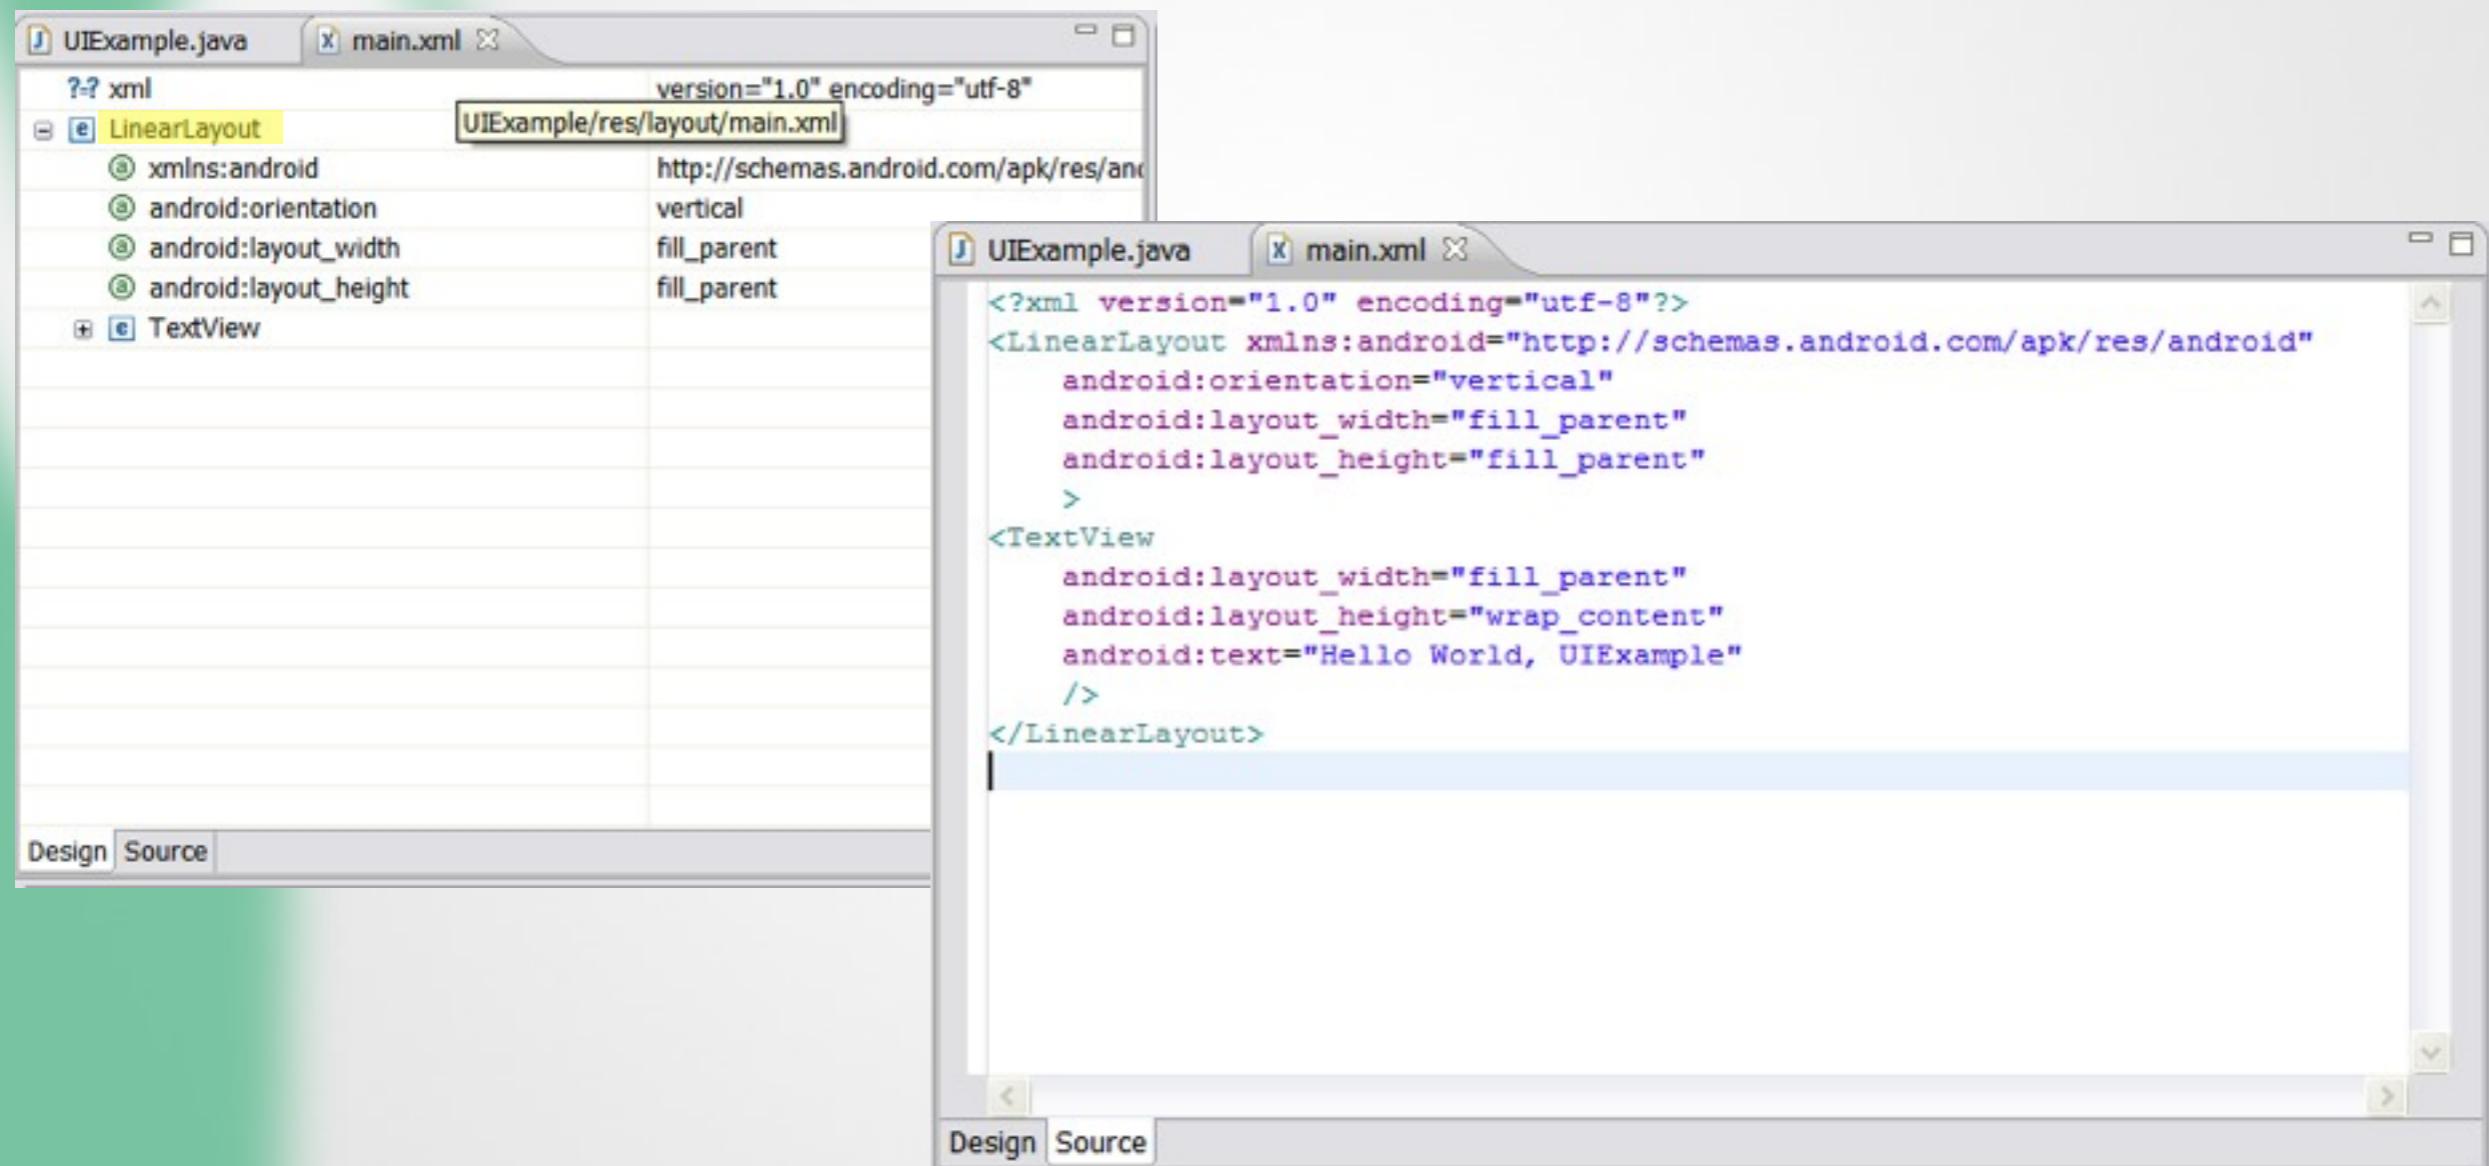

Upgrading UI to XML

- XML-based Layout
 - Inspired by web development model where the presentation of the application's UI is separated from the logic
 - Two files to edit
 - Java file – application logic
 - XML file – user interface

Upgrading UI to XML Layout

Upgrading UI to XML

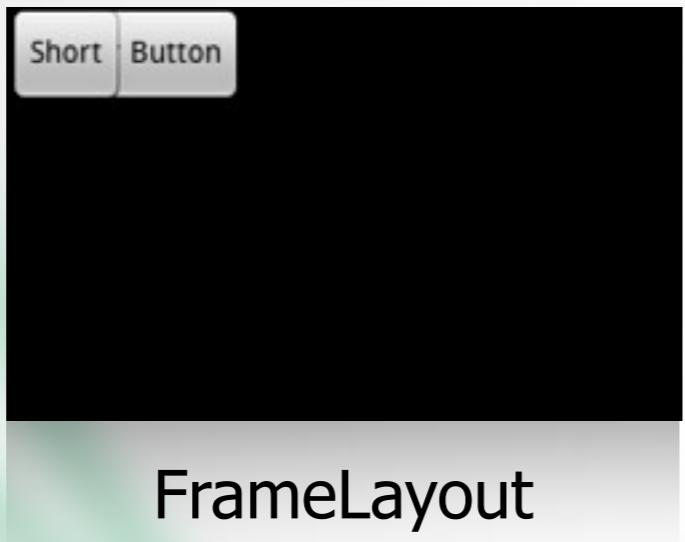

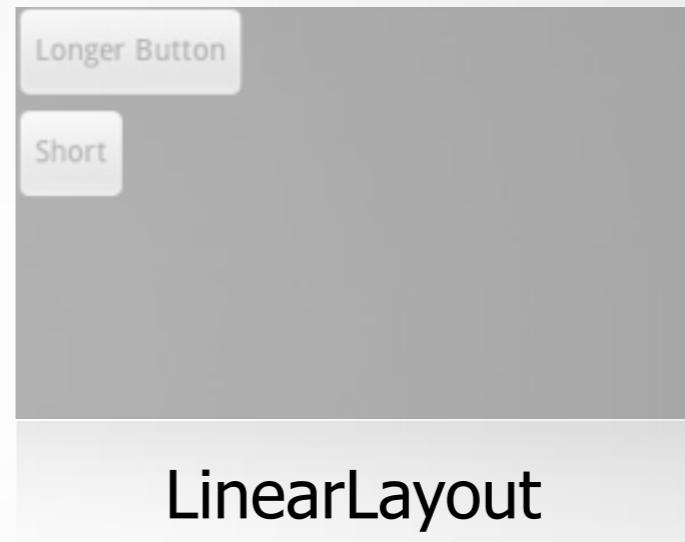

Common Layout Objects

Implementing a User Interface

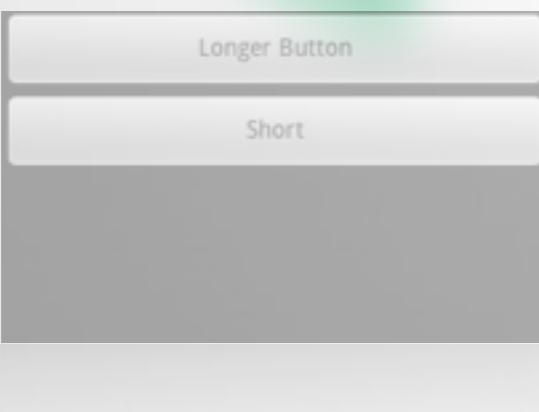

Common Layout Objects

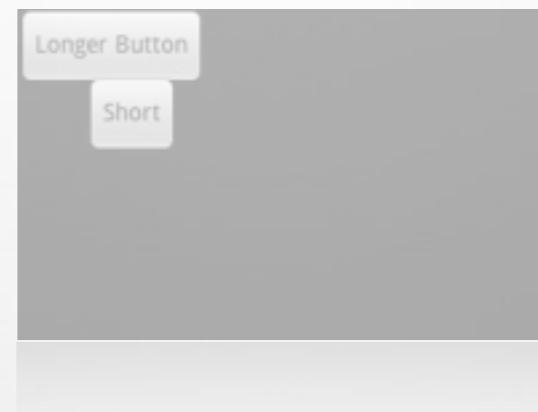

FrameLayout

LinearLayout

TableLayout

AbsoluteLayout

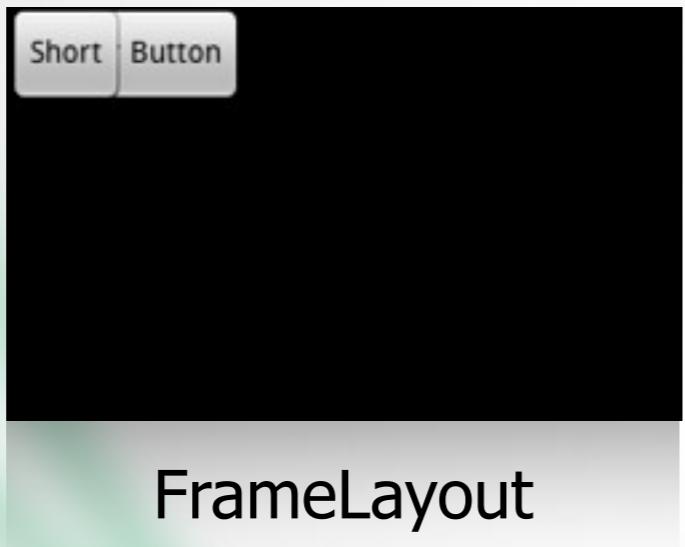

RelativeLayout

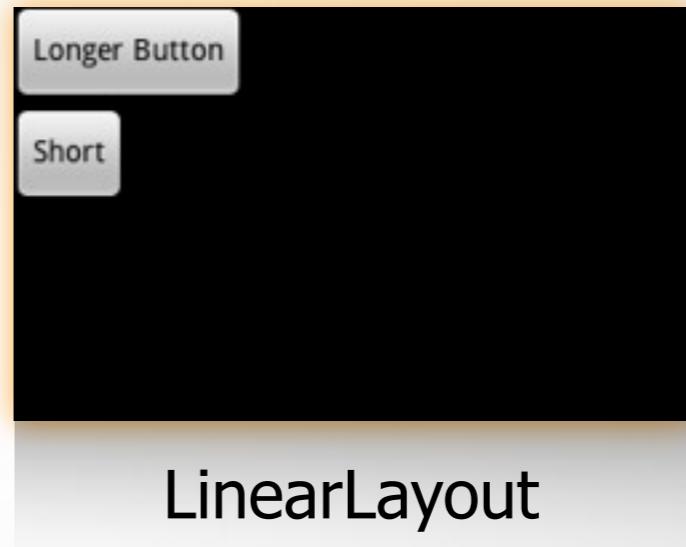

FrameLayout

- Simplest layout object
- Intended as a blank reserved space on your screen that you can later fill with a single object
 - Example: a picture that you'll swap out
- All child elements are pinned to the top left corner of the screen
- Cannot specify a location for a child element

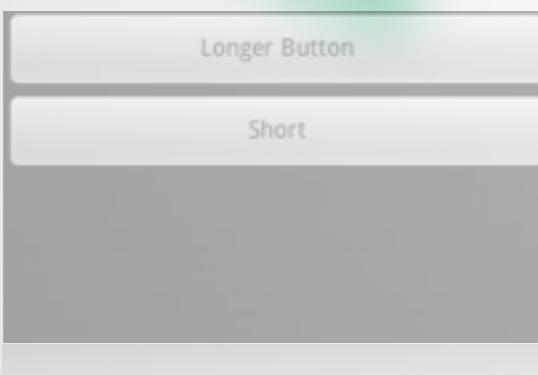

Common Layout Objects

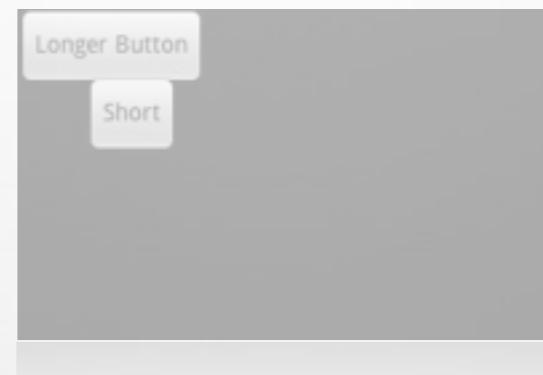

FrameLayout

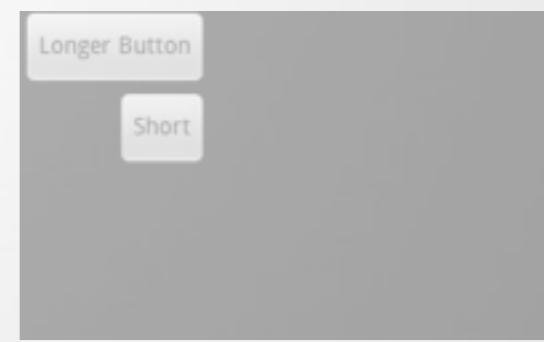

LinearLayout

TableLayout

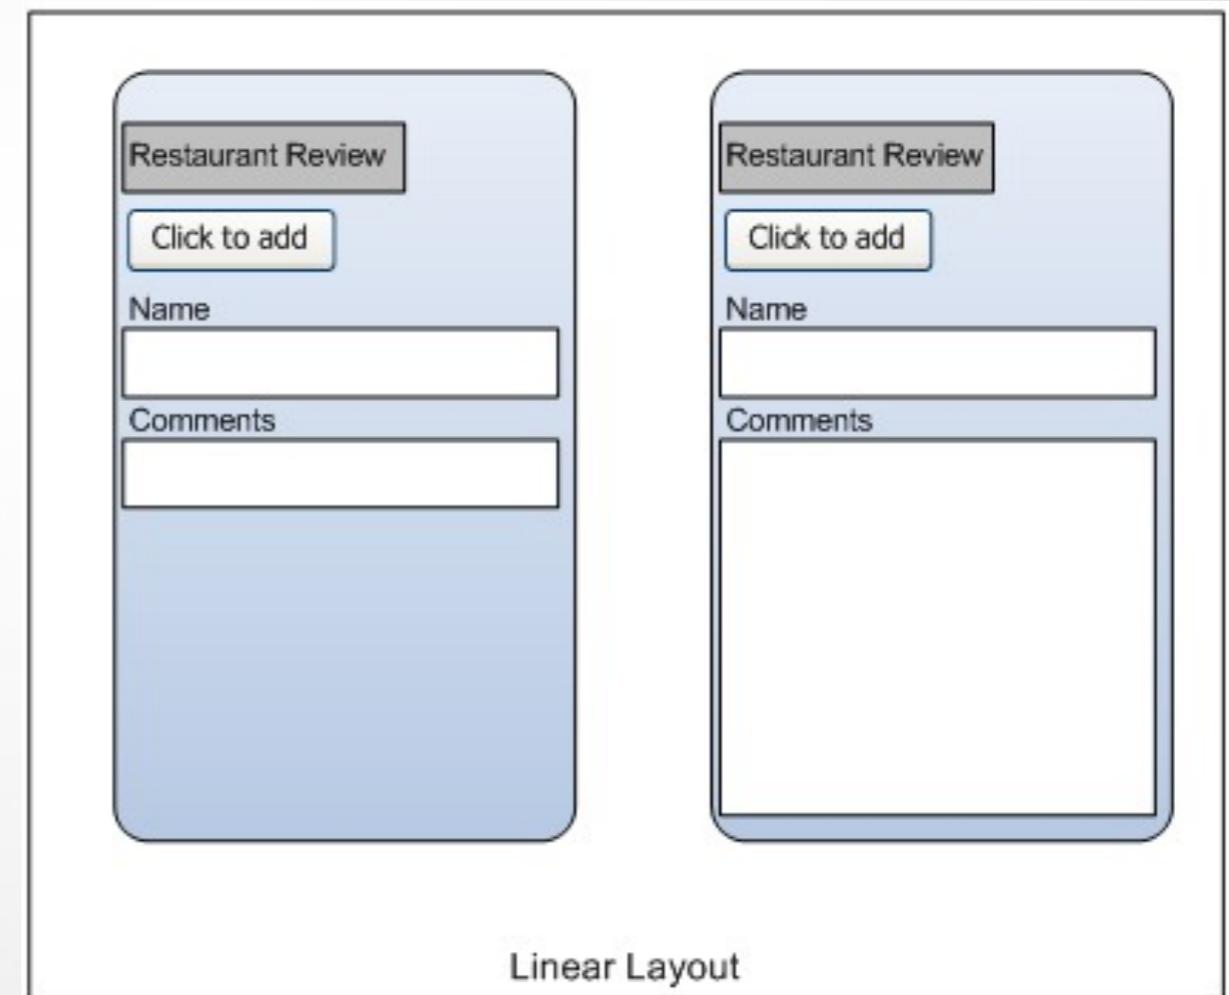

AbsoluteLayout

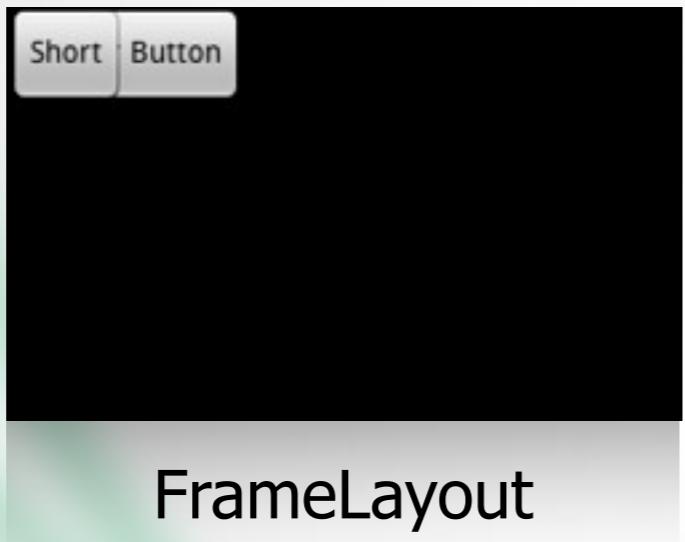

RelativeLayout

LinearLayout

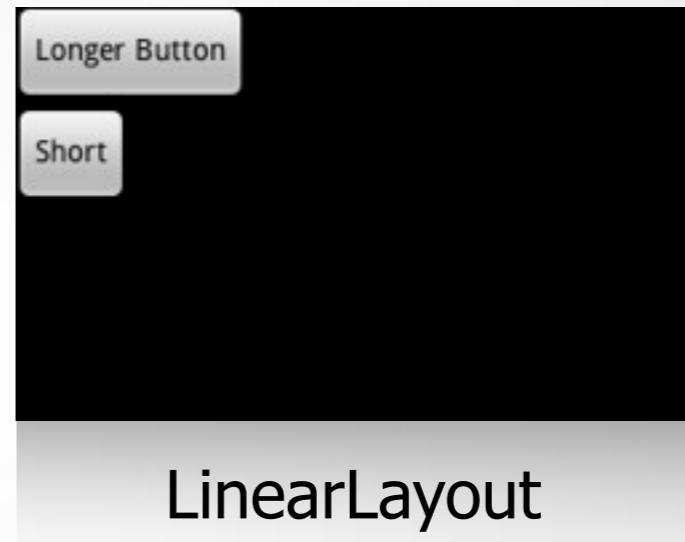

- Aligns all children in a single direction — vertically or horizontally
 - All children are stacked one after the other
 - a vertical list will only have one child per row (no matter how wide they are)
 - a horizontal list will only be one row high (the height of the tallest child, plus padding)

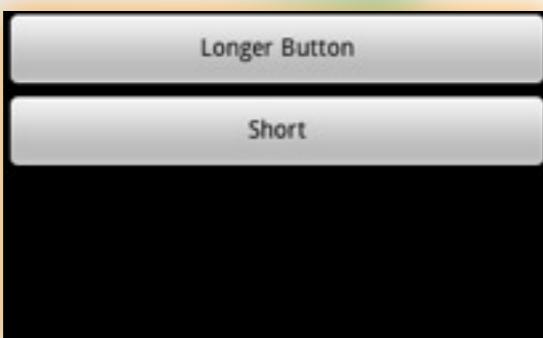

Common Layout Objects

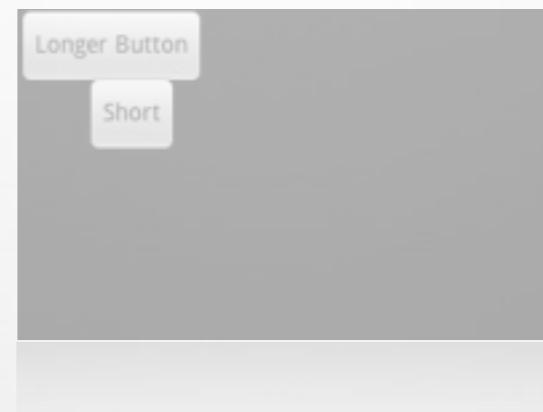

FrameLayout

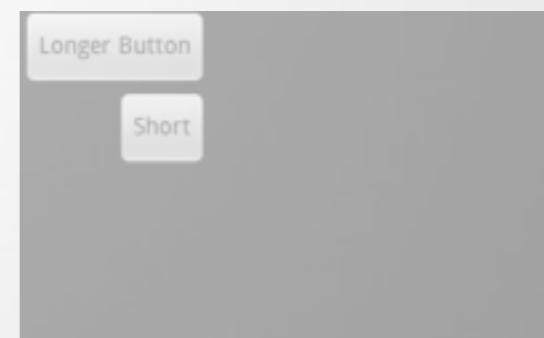

LinearLayout

TableLayout

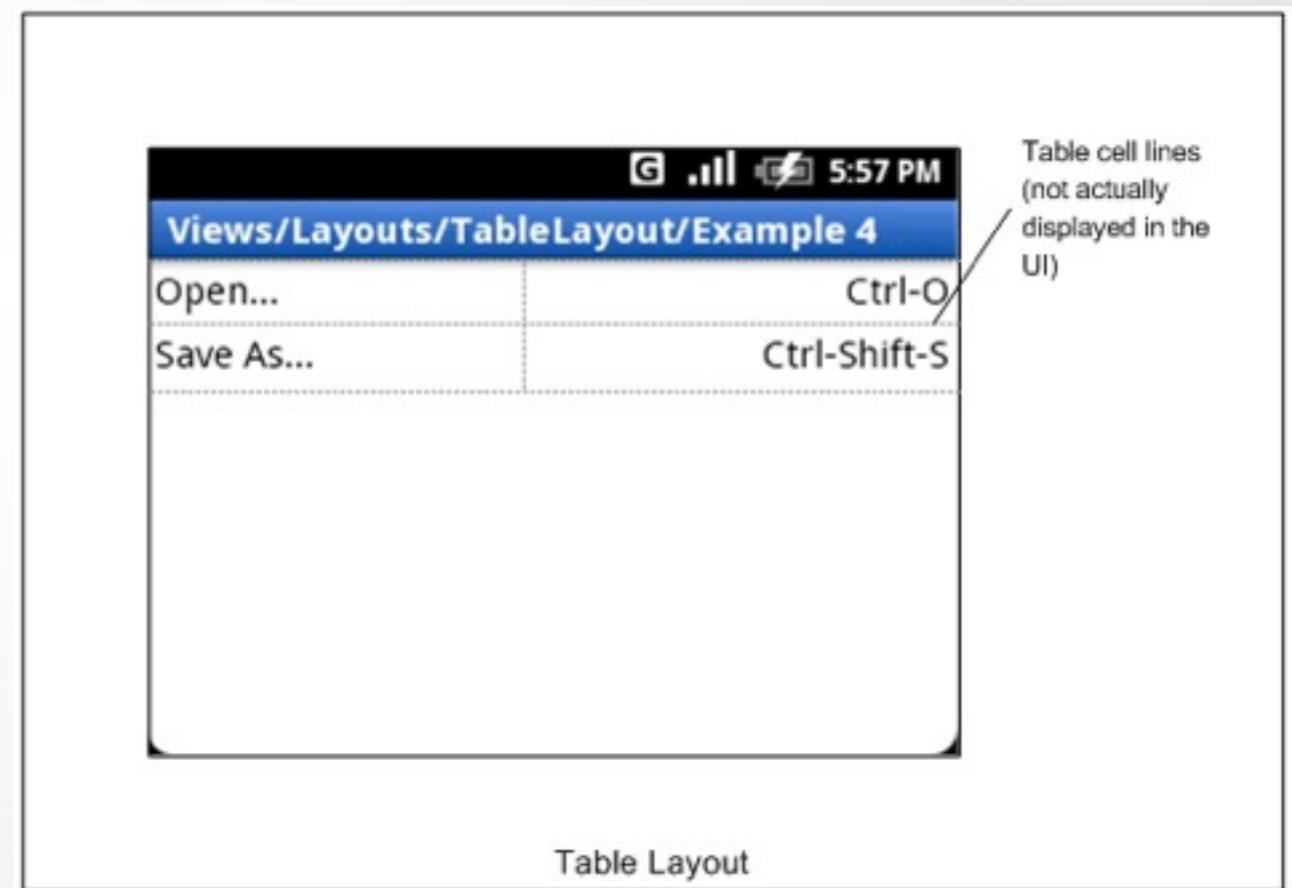

AbsoluteLayout

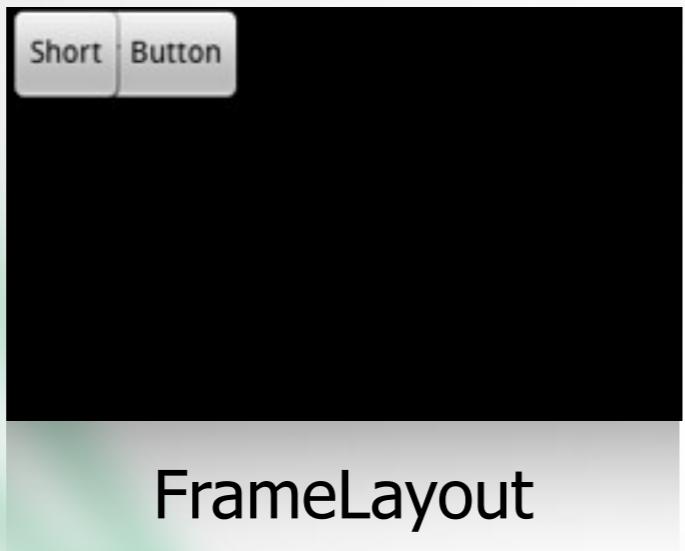

RelativeLayout

TableLayout

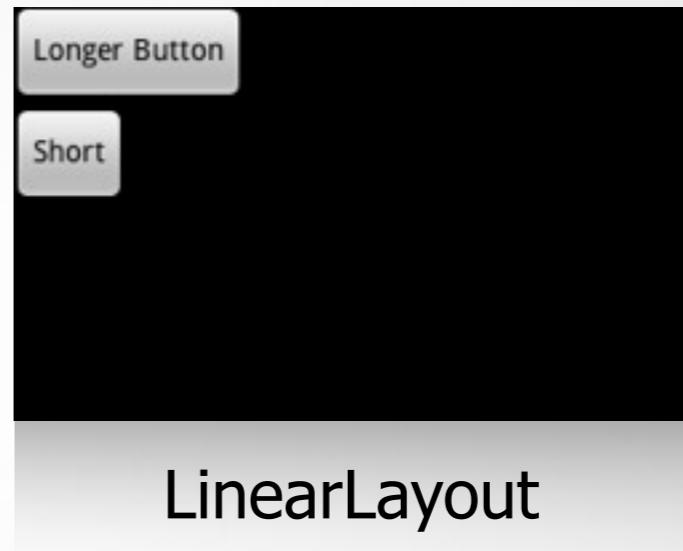

- Positions its children into rows and columns
- Does not display border lines for their rows, columns, or cells
- Cells cannot span columns, as they can in HTML

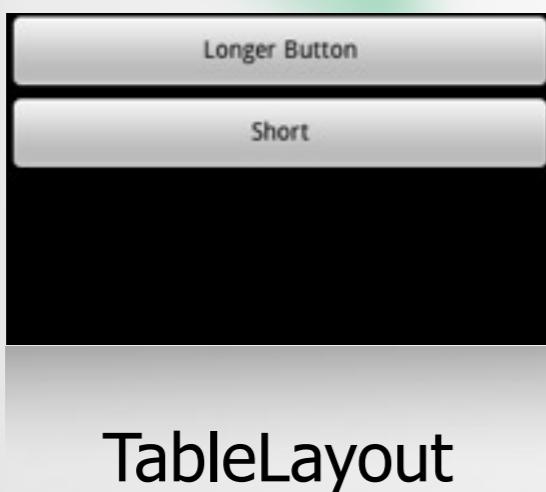

Common Layout Objects

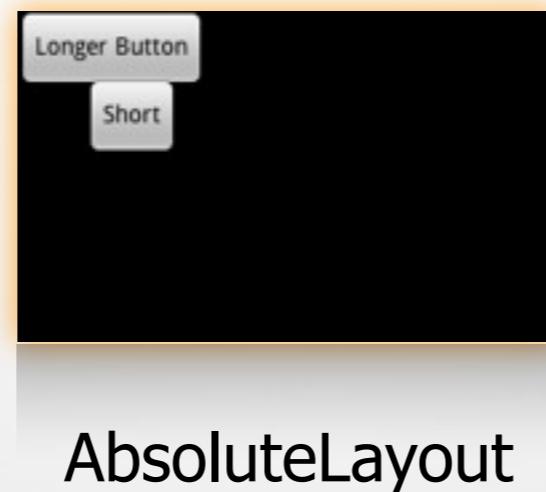

FrameLayout

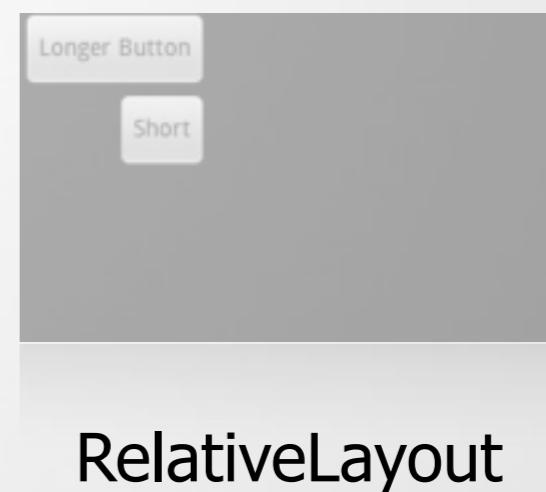

LinearLayout

TableLayout

AbsoluteLayout

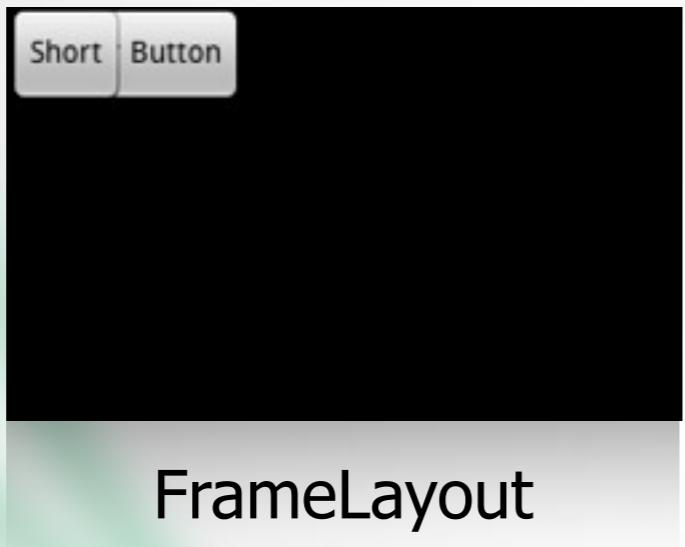

RelativeLayout

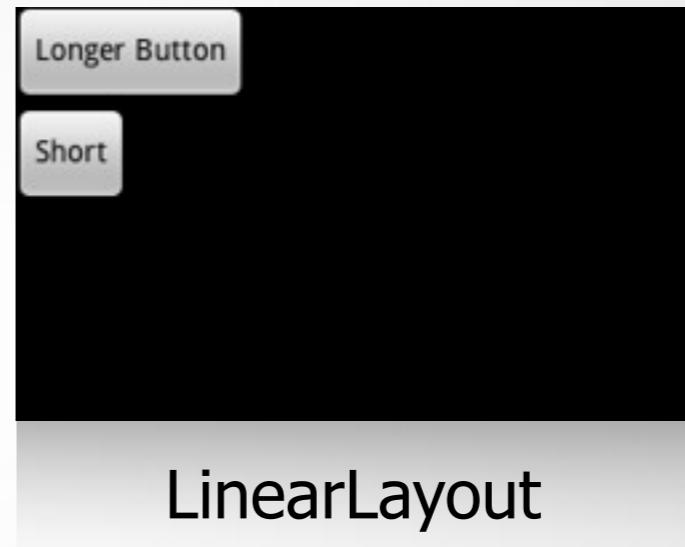

Absolute Layout

- Enables children to specify exact x/y coordinates to display on the screen
 - (0,0) is the upper left corner
 - Values increase as you move down or to the right
- Overlapping elements are allowed (although not recommended)
- NOTE:
 - It is generally recommended NOT to use AbsoluteLayout UNLESS you have good reasons to use it
 - It is because it is fairly rigid and does not work well with different device displays

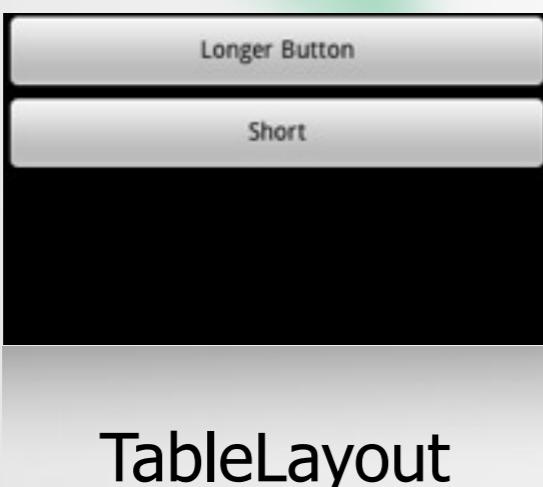

Common Layout Objects

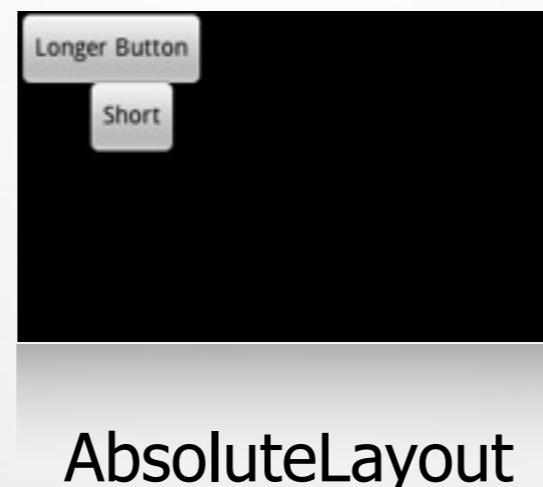

FrameLayout

LinearLayout

TableLayout

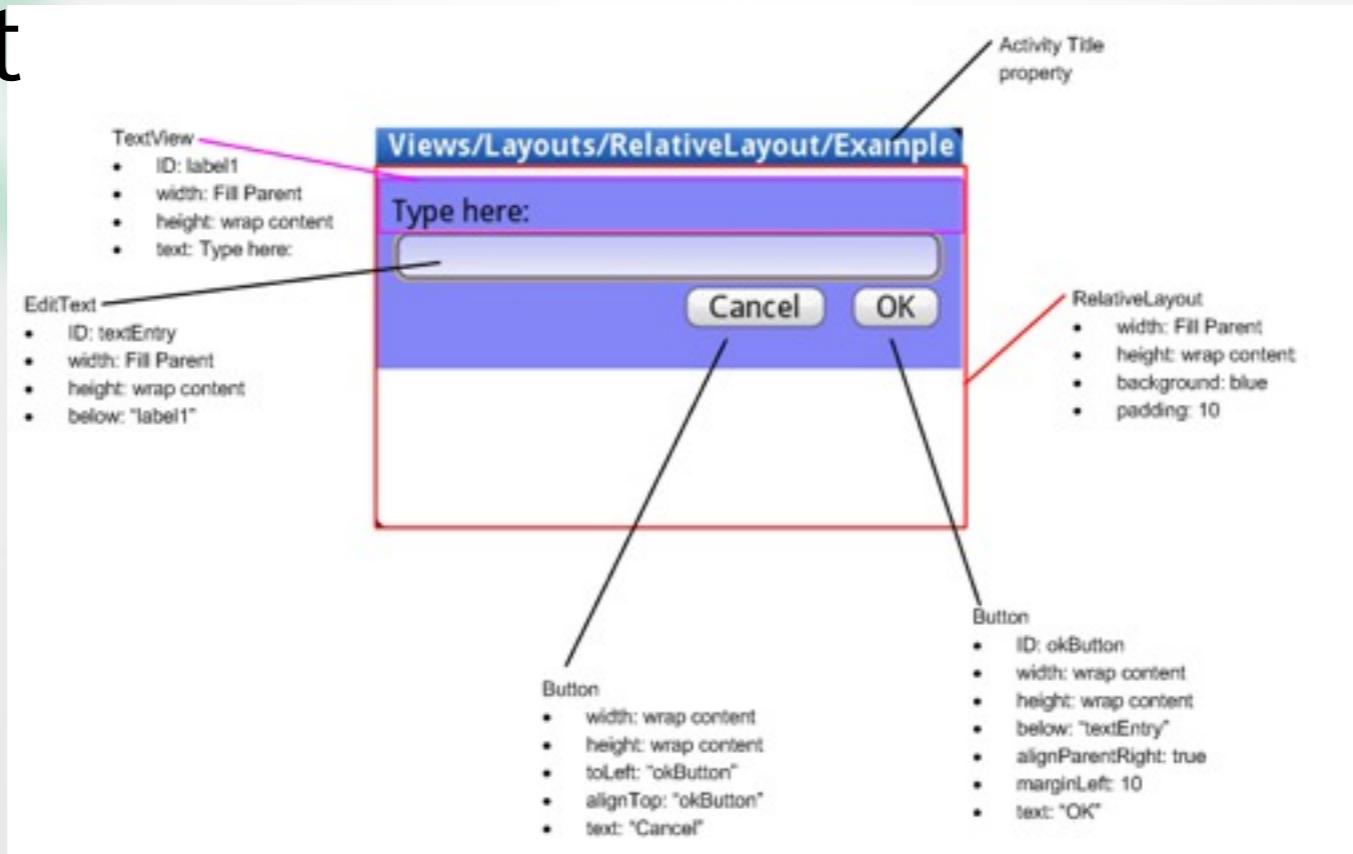

AbsoluteLayout

RelativeLayout

RelativeLayout

- Lets children specify their position relative to each other (specified by ID), or to the parent

Important Layout

Allgemein:

| | |
|---------------------------|-----------------------------------|
| Layout-Height: | fill_parent, wrap_content, Pixels |
| Layout-Width: | fill_parent, wrap_content, Pixels |
| Id: | @+id/my_variable |
| Min-Height, Max-Height... | |
| Min-Width, Max-Width | |

Speziell:

| | | |
|----------------------------|-----------------------|---|
| EditText | Input type | text, textEmailAddress, number, numberDecimal |
| TextView, Button, EditText | Text | @string/resource_id |
| TextView | Text color, Text size | |

Online Reference

The screenshot shows the 'Hello, Views' tutorial page from the Android Developers site. The page features a sidebar with navigation links like 'Home', 'SDK', 'Dev Guide', 'Reference', 'Blog', and 'Community'. The main content area has a title 'Hello, Views' and a brief introduction about the tutorial's purpose. Below the introduction are several examples of different UI views, each with a thumbnail image and a brief description:

- Linear Layout:** A grid with four colored cells (red, green, blue, yellow) labeled 'row one' through 'row four'.
- Relative Layout:** A grid with three rows and two columns.
- Table Layout:** A grid with three rows and three columns.
- Date Picker:** A date selection dialog showing '05, 14 August, 2008'.
- Time Picker:** A time selection dialog showing '8:27 PM'.
- Form Edit:** A text input field with a placeholder 'Enter name'.
- Spinner:** A dropdown menu with items 'New York', 'Los Angeles', 'Chicago', 'Houston', 'Phoenix', 'San Antonio', 'Dallas', and 'Austin'.
- AutoComplete:** A dropdown menu with items 'Carrie Anne', 'Coco (cheating) (Android)', 'Cordelia', 'Constance', 'Cynthia', and 'Dango'.

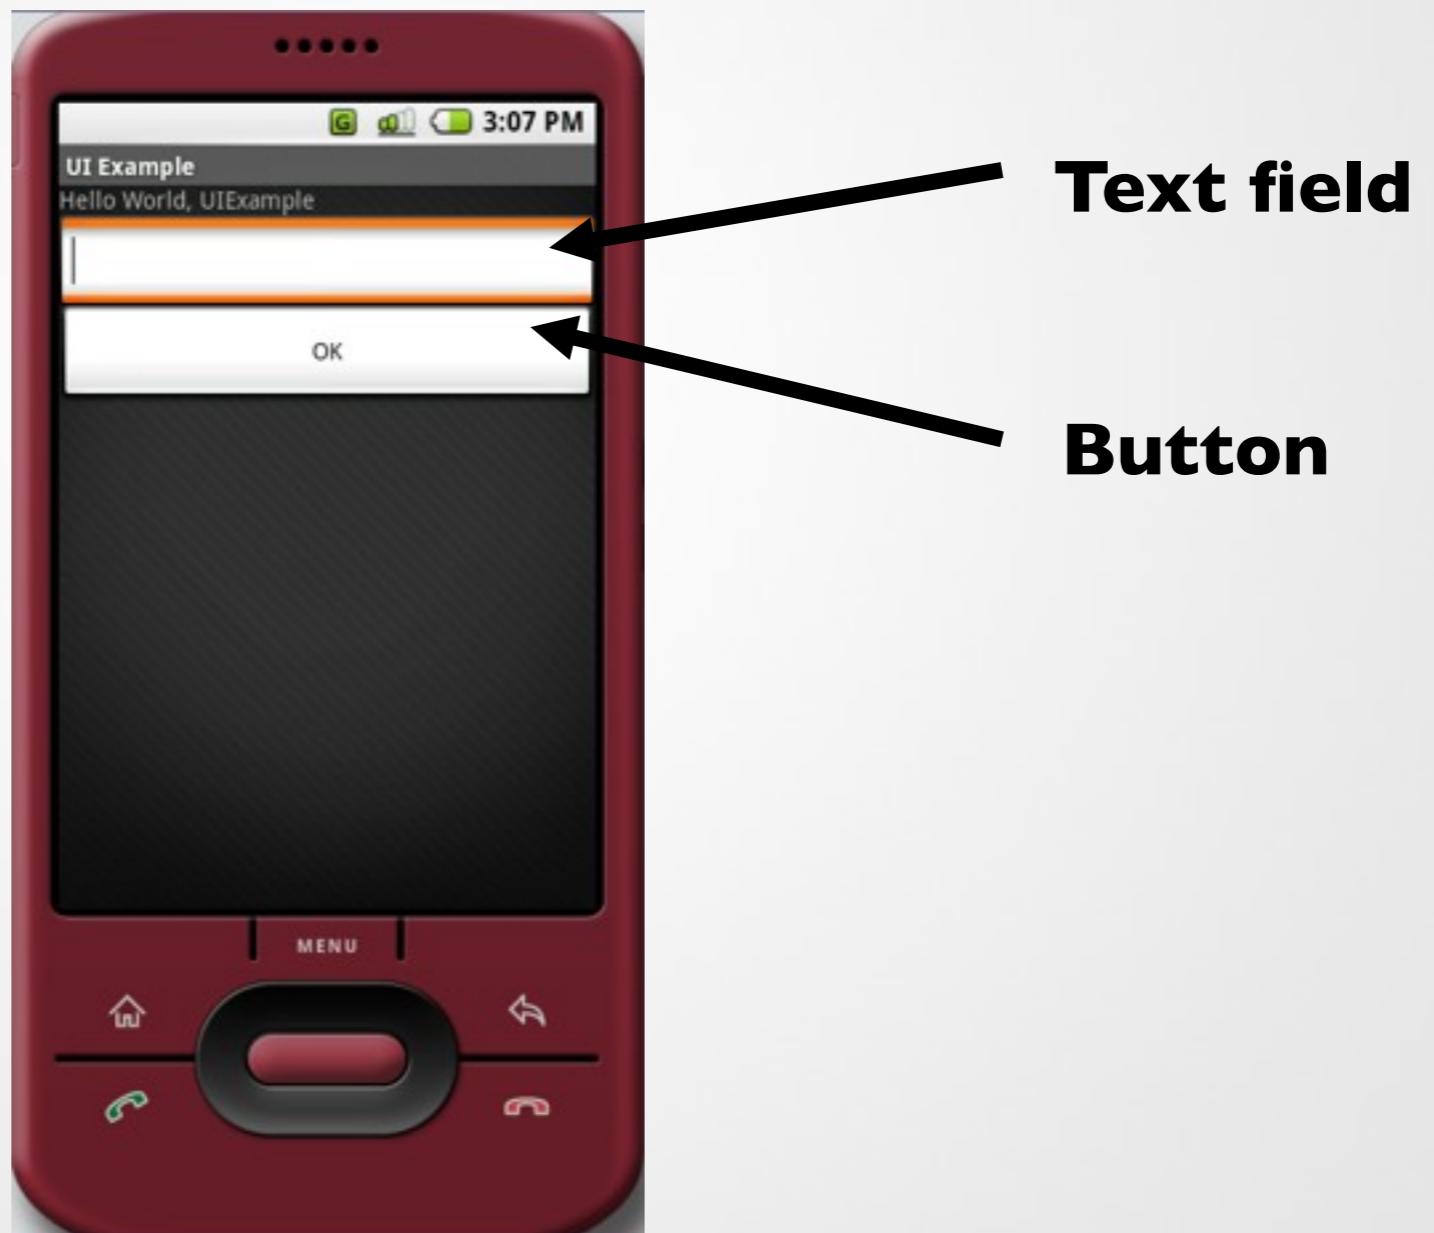

Below these examples is a section titled 'ListViews' showing a list of countries, and another section titled 'GridView' showing a grid of images. At the bottom of the page is a footer with copyright information and a link to 'Go to top'.

<http://developer.android.com/guide/tutorials/views/index.html>

Hooking into a Screen Element

Implementing a User Interface

Hooking into a Screen

Hooking into a Screen Element

The screenshot shows the Android Studio interface with the code editor open. The tab bar at the top has 'UIExample.java' and 'main.xml'. The main area displays the XML code for a layout:

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:orientation="vertical"
    android:layout_width="fill_parent"
    android:layout_height="fill_parent"
    >

    <TextView
        android:layout_width="fill_parent"
        android:layout_height="wrap_content"
        android:text="Hello World, UIExample"
        />

    <EditText
        android:id="@+id/name_entry"
        android:layout_width="fill_parent"
        android:layout_height="wrap_content"
        />

    <Button
        android:id="@+id/ok"
        android:layout_width="fill_parent"
        android:layout_height="wrap_content"
        android:text="OK"
        />

</LinearLayout>
```

The entire code block is highlighted with a yellow background. At the bottom of the code editor, there are two tabs: 'Design' and 'Source', with 'Source' being the active tab.

Hooking into a Screen Element

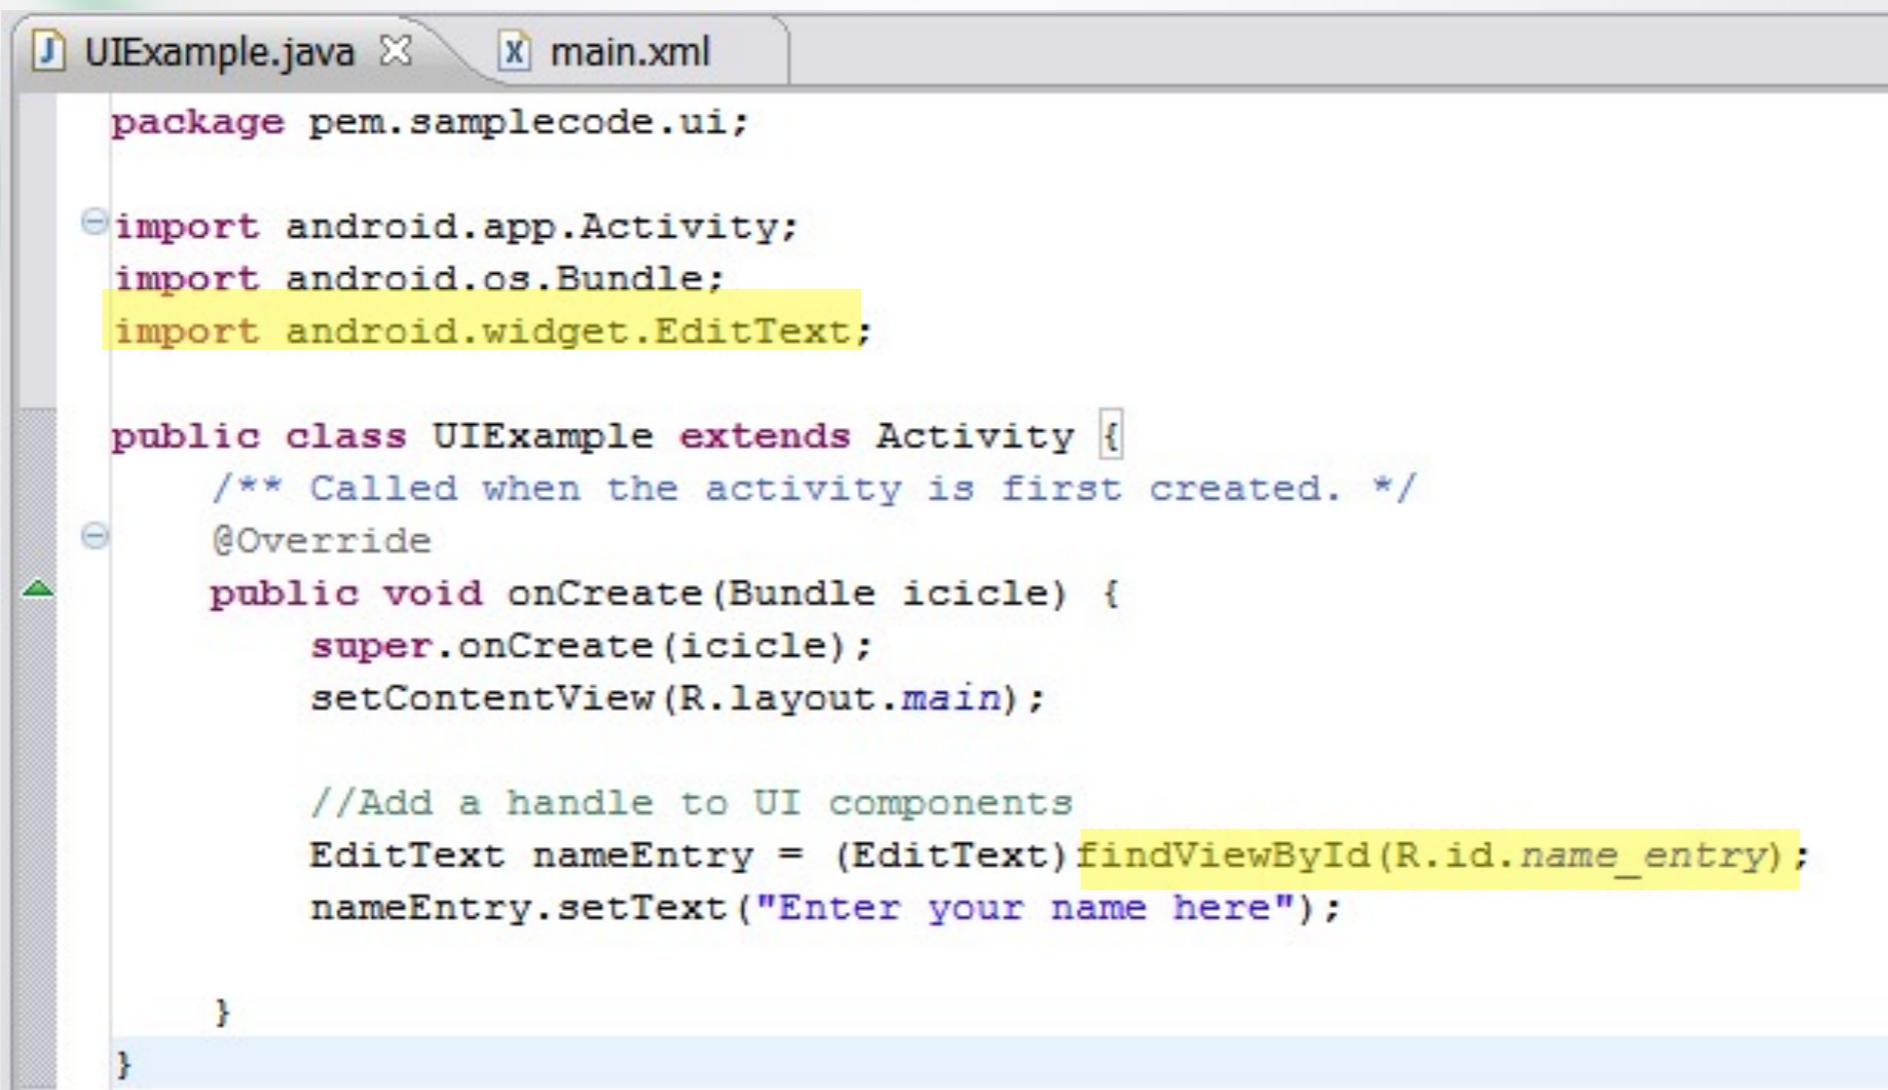

```
<EditText  
    android:id="@+id/name_entry"  
    android:layout_height="wrap_content"  
/>  
  
<Button  
    android:id="@+id/ok"  
    android:layout_width="fill_parent"  
    android:layout_height="wrap_content"  
    android:text="OK"  
/>
```

@+id syntax:

Creates a resource number in the R class (R.java file) if one doesn't exist, or uses it if it does exist.

Any String value
(no spaces)

Hooking into a Screen Element

The screenshot shows an IDE interface with two tabs at the top: "UIExample.java" and "main.xml". The "UIExample.java" tab is active, displaying the following Java code:

```
package pem.samplecode.ui;

import android.app.Activity;
import android.os.Bundle;
import android.widget.EditText;

public class UIExample extends Activity {
    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle icicle) {
        super.onCreate(icicle);
        setContentView(R.layout.main);

        //Add a handle to UI components
        EditText nameEntry = (EditText) findViewById(R.id.name_entry);
        nameEntry.setText("Enter your name here");
    }
}
```

The code imports the necessary Android packages and defines a new Activity named UIExample. It overrides the onCreate method to set the content view to "main" and then finds a UI component with the ID "name_entry" using the findViewById method. Finally, it sets the text of the found EditText to "Enter your name here". The line "EditText nameEntry = (EditText) findViewById(R.id.name_entry);" is highlighted with a yellow background.

Hooking into a Screen Element

Listening for UI Notifications

The screenshot shows the code editor of an Android Studio project. The file is named `UIExample.java`. The code implements a simple UI example where the user can enter their name and click a button to finish the activity.

```
UIExample.java
main.xml

package pem.samplecode.ui;

import android.app.Activity;
import android.os.Bundle;
import android.view.View;
import android.view.View.OnClickListener;
import android.widget.Button;
import android.widget.EditText;

public class UIExample extends Activity {
    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle icicle) {
        super.onCreate(icicle);
        setContentView(R.layout.main);

        //Add a handle to UI components
        EditText nameEntry = (EditText)findViewById(R.id.name_entry);
        nameEntry.setText("Enter your name here");

        Button okButton = (Button)findViewById(R.id.ok);

        //Create an anonymous class to act as a button click listener
        okButton.setOnClickListener(new OnClickListener() {
            public void onClick(View v){
                setResult(RESULT_OK, "Done!");
                finish();
            }
        });
    }
}
```

Resource Folders and Localization

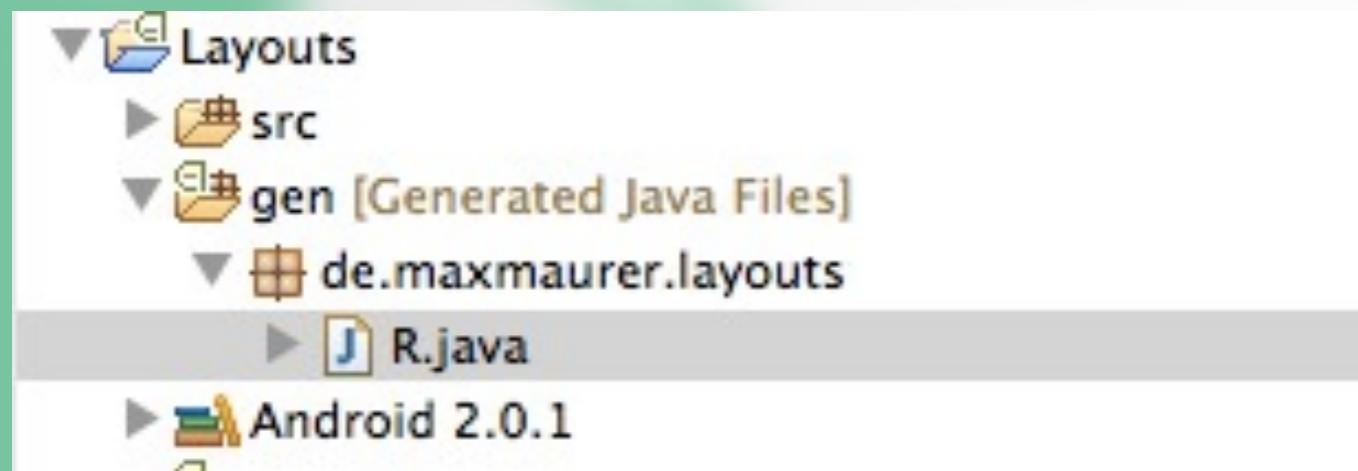

Implementing a User Interface

Resource Folders

Resource Folders

- Folder structure is automatically parsed into Resource-File
 - Do not modify this file!

```
+/* AUTO-GENERATED FILE. DO NOT MODIFY. */

package de.maxmaurer.layouts;

public final class R {
    public static final class attr {
    }

    public static final class drawable {
        public static final int icon=0x7f020000;
    }

    public static final class id {
        public static final int Button01=0x7f050001;
        public static final int Button02=0x7f050000;
    }

    public static final class layout {
        public static final int main=0x7f030000;
    }

    public static final class string {
        public static final int app_name=0x7f040001;
        public static final int hello=0x7f040000;
    }
}
```

Resource Folders

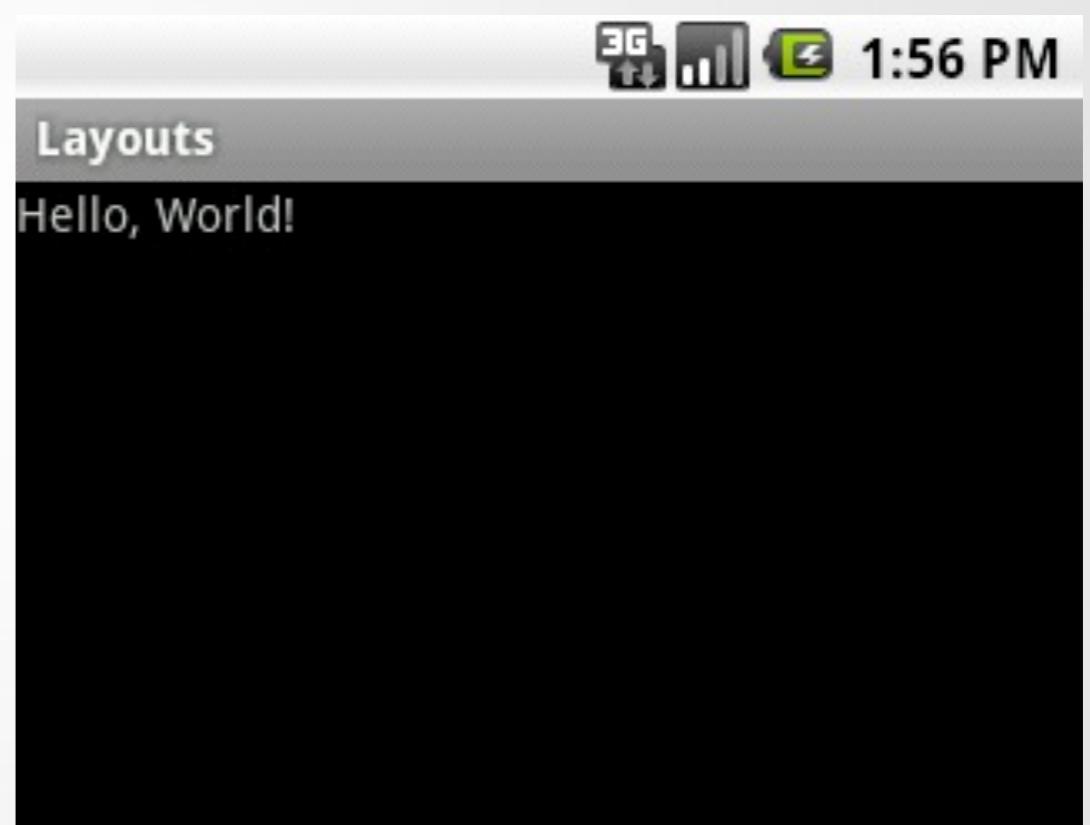

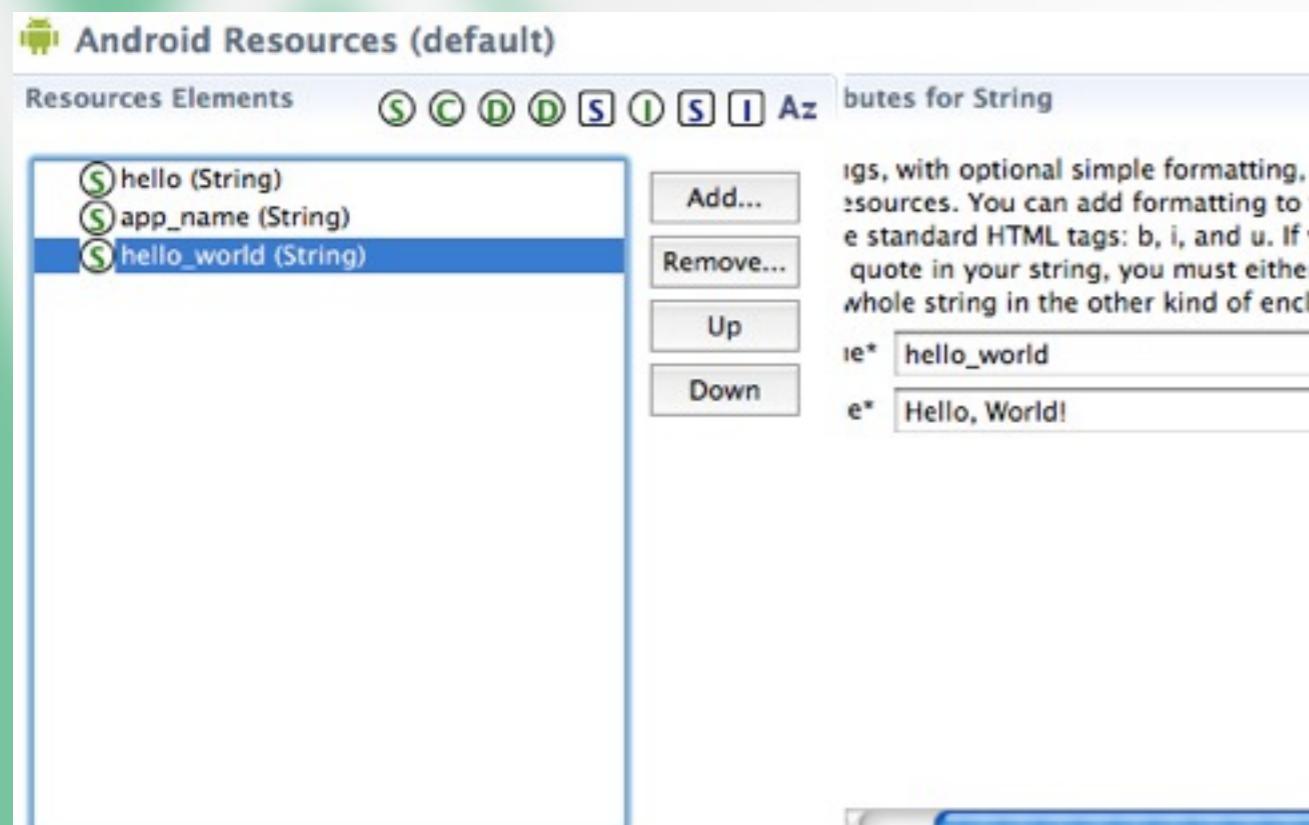

- Separate storage of Strings and Graphics
- Makes it easier to modify software parts
- Resources are accessed via „R.java“

```
package de.maxmaurer.layouts;

import android.app.Activity;

public class Layouts extends Activity {
    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        View v = findViewById(R.layout.main);
        TextView tv = new TextView(this);
        tv.setText(getString(R.string.hello_world));
        setContentView(v);
    }
}
```

Resource Folders

Localization

- Creating folders for other languages does not need any code change
- Watch the application size!

Localization

The screenshot shows the Android Resource Editor interface. On the left, under 'Resources Elements', there are tabs for S (Strings), C (Colors), D (Drawables), S (Shapes), I (Icons), and Az (Attributes). The 'S' tab is selected. In the main area, a list contains one item: 'hello_world (String)'. To the right of the list are buttons for 'Add...', 'Remove...', 'Up', and 'Down'. Below the list, a detailed view for 'hello_world' shows the following information:

- Attributes for hello_world (String)**
- Description:** Strings, with optional simple formatters as resources. You can add formatters or a quote in your string, you must enclose the whole string in the other kind.
- Name***: hello_world
- Value***: Hallo, Welt!

On the right side of the screen, there is a preview window titled 'Layouts' showing the text 'Hallo, Welt!'.

Localization

- May be used for other device specific things as well
 - Country
 - Screen dimensions
 - Screen orientation
 - Touchscreen type (finger, stylus)
 - and many more

Localization

- May be used for other device specific things as well
 - Country
 - Screen dimensions
 - Screen orientation
 - Touchscreen type (finger, stylus)
 - and many more

```
MyApp/  
  res/  
    drawable-en-rUS-large-long-port-mdpi-finger-keysexposed-qwerty-navexposed-dpad-480x320/
```

Application Themes

Implementing a User Interface

Applying a Theme to Your Application

- Default theme: android.R.style.Theme
 - <http://developer.android.com/reference/android/R.style.html>
- Two ways to set the theme
 - Adding the theme attribute in `AndroidManifest.xml`
 - Calling `setTheme()` inside the `onCreate()` method

Editing

- Adding the theme attribute in AndroidManifest.xml

```
<?xml version="1.0" encoding="utf-8"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="pem.samplecode.ui">
    <application android:icon="@drawable/icon"
        android:theme="@android:style/Theme.Black">
        <activity android:name=".UIExample" android:label="@string/app_name">
            <intent-filter>
                <action android:name="android.intent.action.MAIN" />
                <category android:name="android.intent.category.LAUNCHER" />
            </intent-filter>
        </activity>
    </application>
</manifest> |
```

Applying a Theme using Code

- Calling `setTheme()` inside the `onCreate()` method

The screenshot shows the Android Studio interface with three tabs at the top: "UIExample.java", "main.xml", and "AndroidManifest.xml". The "UIExample.java" tab is selected and contains the following Java code:

```
package pem.samplecode.ui;

import android.app.Activity;
import android.os.Bundle;

public class UIExample extends Activity {
    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle icicle) {
        super.onCreate(icicle);

        setTheme(android.R.style.Theme_Black);
        setContentView(R.layout.main);
    }
}
```

The line `setTheme(android.R.style.Theme_Black);` is highlighted with a yellow background.
