Multimedia Services

10 Streaming Architectures

10.1 High-Level Streaming Architecture

10.2 Real-Time Data Transport

10.3 Scalability and Multicast

10.4 Selected Commercial Streaming Architectures

Literature:

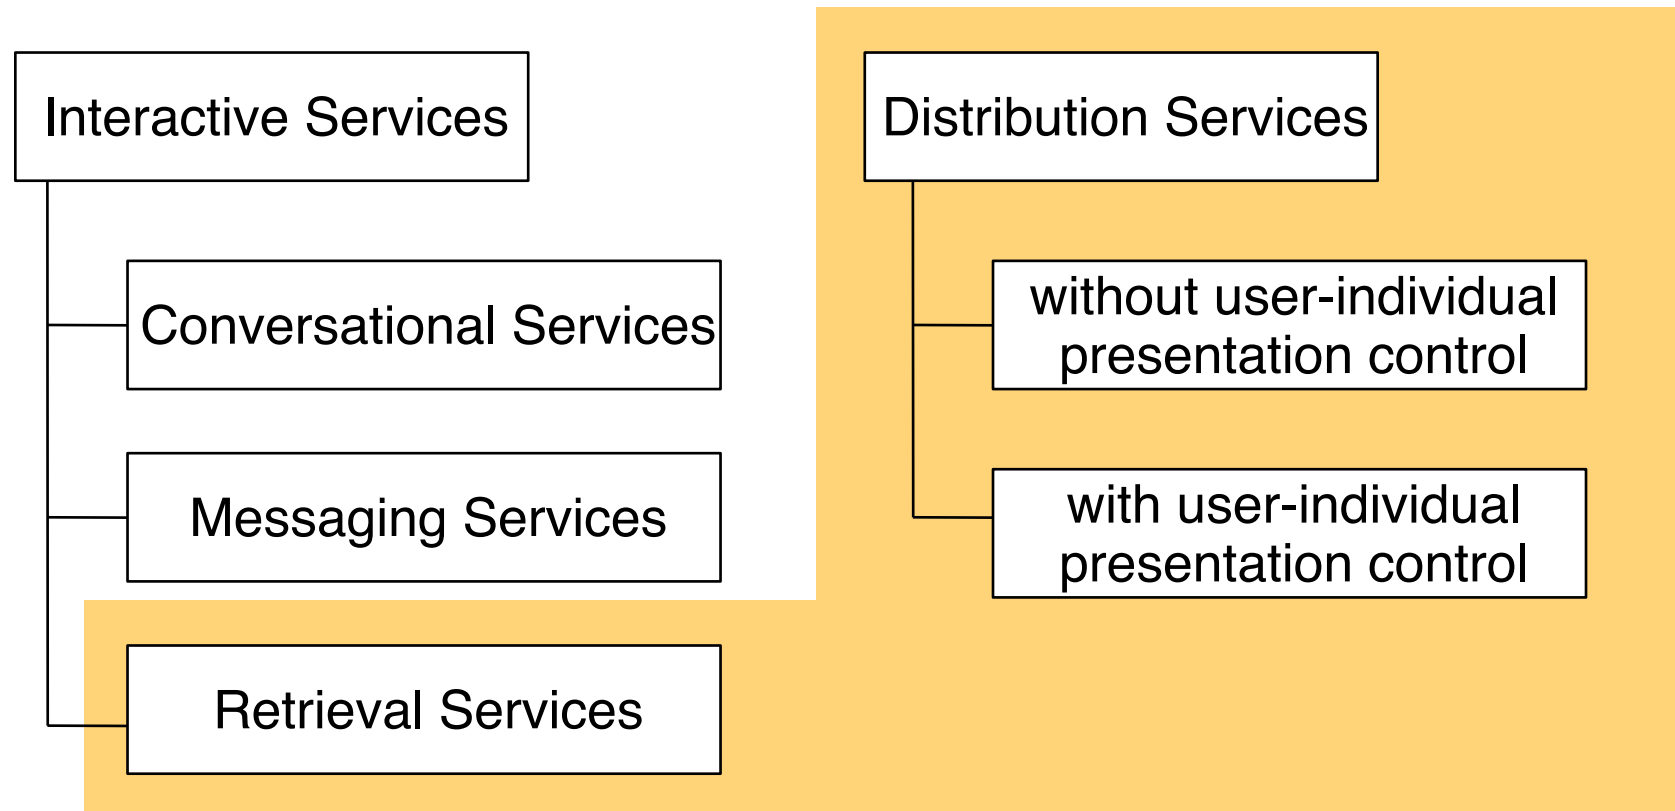

David Austerberry: The Technology of Video & Audio Streaming,
Focal Press 2002

Gregory C. Demetriades: Streaming Media, Wiley 2003

Tobias Künkel: Streaming Media – Technologien, Standards,
Anwendungen, Addison-Wesley 2001

A Classification of Multimedia Services

- According to ITU-T recommendation I.211 “B-ISDN Service Aspects”

Presentation Control in Distribution Services

- **Without** user-individual presentation control:
 - Continuous “live” stream of information from sender to receiver(s)
 - Replacement of other distribution media (e.g. radio) by digital networks
 - » Real-time service (e.g. fixed start time for transmission)
- **With** user-individual presentation control:
 - Pause, resume, skip backward, skip forward
 - **Server** control:
 - » Individual stream (or group of closely related streams)
 - **Client-local** control:
 - » Outdated solution for interactivity: “Near Video-on-Demand” (NVOD) = Staggered broadcast of multiple transmissions of the same content
 - » Time-shifted recording enhances interactivity (pause/resume)
 - Full transmission of video content on local storage before playback enables full interactivity
 - » Modern solutions enabled by high-capacity local disks (e.g. AppleTV, Sky Anytime)

Unicast, Broadcast, Multicast, Anycast

Unicast:
One specific receiver

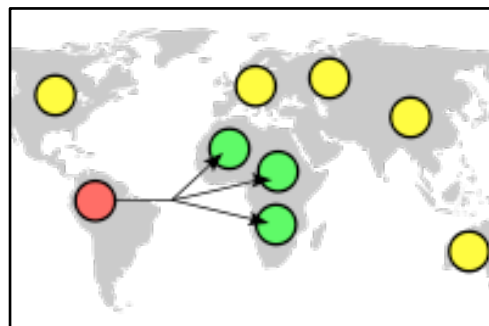

Broadcast:
Many receivers, all on the network

Multicast:
Many receivers, all of a specific group

Anycast:
One receiver, "nearest" of a specific group

Geocast:
Many receivers, all of a geographic region

Pictures: Wikipedia

Bandwidth Economy

- Fully heterogeneous individual requests:
 - Required bandwidth = stream bandwidth x number requests
- Homogeneity of request helps saving bandwidth:
 - Same content for many clients, but different playback times:
 - » Broadcast with local buffering
 - Same content at same time for many clients
 - » Multicast (splitting streams)
- Pre-planning saves bandwidth
 - (Individual) transmission of pre-booked content in non-real time (“download and play”)

Streaming, Streaming Media

- *Streaming media* means real-time delivery of moving images, moving text and sound, from a server to client (over the Internet).
- Delivery types for audio and video content:
 - *Download and Play*: Content must be downloaded completely to the client before it can be played
 - *Progressive Download*: Playback is started while download is still in progress. Download rate independent of program bit rate.
 - *True Streaming*: Delivered media is viewed/listened in “real-time”.
 - » Playback takes place with roughly the same rate as delivery of data
 - » Delay between send and receive event of data packet kept small
- Subtypes of True Streaming:
 - *Static File Streaming*: Delivery of pre-recorded media files. Often also called *on-demand* delivery (e.g. *Video on Demand*)
 - *Live Streaming*

Based on material from www.streamingalliance.org

Session

- A *session* is an association between communicating parties, which
 - Persists over a limited time span
 - Incorporates at least two parties
 - May comprise a large number of communication connections of different characteristics
- Examples of sessions:
 - Movie streamed to consumer, consisting of audio and video parts
 - Multimedia conference among five participants, consisting of audio and video source from each of the participants (plus possibly some global information)
- Session awareness at which levels?
 - At application level: unavoidable
 - At network level: possible
 - » Requires specific protocols

Streaming Delivery Chain

Encoding

- Format conversions
 - E.g. analog/digital conversion
 - E.g. downscaling of picture size
- Compression
 - Adequate for player capabilities and typical transmission bandwidth
- Indexing
 - Analyzing internal structure
- Metadata creation
 - Possibly including digital rights specification

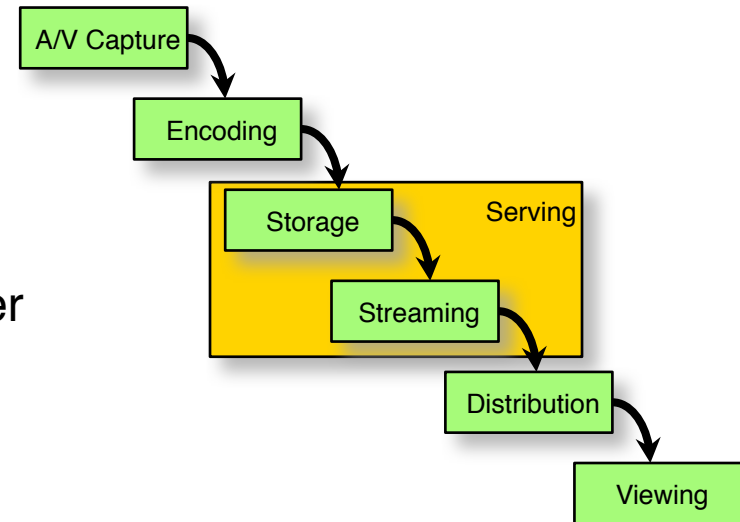

Serving

- Storage
 - Live: only buffering and archiving
 - Static files: archive management, retrieval
- Streaming
 - Pull model:
 - » Request-response driven similar to Web server
 - Push model:
 - » Server sends packets at regular intervals
- Interactivity
 - VCR-like control (PLAY, STOP, PAUSE, FFWD, REW)
 - Random access based on various criteria
 - Hyperlinks in A/V material (“hypervideo”)
- Transcoding
 - Encoding adapted to client capabilities

Distribution

- Key topic: Quality of Service (QoS)
 - Determining realizable bandwidth, delay, jitter
- Key concepts:
 - Overprovisioning
 - Detailed reservations (“Integrated Services”, reservation protocol RSVP)
 - » Difficult to scale to large numbers of users
 - Traffic classes (“Differentiated Services”)
 - » Difficult to control access to privileges
 - Resource management layer
 - Technology-specific solutions
 - » E.g. ATM (Asynchronous Transfer Mode)

10 Streaming Architectures

10.1 High-Level Streaming Architecture

10.2 Real-Time Data Transport

10.3 Scalability and Multicast

10.4 Selected Commercial Streaming Architectures

Literature:

David Austerberry: *The Technology of Video & Audio Streaming*,
Focal Press 2002

Stephan Rupp, Gerd Siegmund, Wolfgang Lautenschlager:
SIP – Multimediale Dienste im Internet. dpunkt 2002

A. Begen, T. Akgul, M. Baugher: *Watching Video over the Web*,
Part I: Streaming Protocols, *IEEE Internet Computing*,
March/April 2011

IP and TCP

- Internet Protocol
 - Network communication protocol (ISO layer 3)
 - Packets transferred from address to address (through routers)
 - Main problems:
 - » Variable network latency
 - » Packet order on arrival may be different than on sending
 - » Packets may be lost
- Transport Control Protocol (TCP)
 - Connection establishment (by “three-way handshake”)
 - » Connections are sequences of associated IP packets
 - Sequencing of bytes with forwarding acknowledgement number
 - Non-acknowledged bytes are re-transmitted after a defined time period
 - Flow control
- For audio/video streaming:
 - Retransmissions (and associated delays) are harmful
 - Lost packets can be tolerated to some extent

UDP

- User Datagram Protocol (UDP)
- Extremely simple transport protocol over IP
 - Connectionless (TCP: connection-oriented)
 - Unreliable (TCP: reliable)
 - No flow control (TCP: has flow control)
- Contents of a UDP datagram:
 - Ports used by application program
 - Checksum
- Basically adequate for media data transport
 - In particular for **pull**-model true streaming
 - Very efficient, protocol overhead of TCP avoided
 - Flow control and handling of packet loss have to be handled by higher protocol layer

Streaming with HTTP?

- **Pull** model:
 - Client requests next slice of audio/video information from server
 - Server responds with audio/video data
- Very popular in Web-based multimedia services
 - e.g. YouTube video
 - e.g. MP3-Streaming with ShoutCast, Live365
- Advantage:
 - Ubiquitous protocol, no problems with firewalls etc.
- Main problems:
 - HTTP usually run over TCP, creates overhead
 - Progressive download rather than true streaming
 - Sometimes user has to select requested quality/bitrate
- Consequence:
 - Specialized streaming protocols: “Adaptive HTTP Streaming” (see later)

Real-Time Transport Protocol RTP

- Transport protocol specifically developed for streaming data
 - IETF (Internet Engineering Task Force) RFC (Request for Comments) 1889
- RTP packets contain
 - Sequence number
 - Time stamp
 - Identification of sender and destination
- RTP usually carried over UDP
- Very important:
 - **RTP does not at all change the way how IP packets are transferred in the network!**
 - To achieve “Quality of Service”, additional network technologies are required (see above)
- RTP used (for instance) by:
 - Apple QuickTime architecture
 - RealSystems streaming architecture

RTP Packets and Other Protocols

- IP Header:
 - Source address, destination address, length, time to live, ...
- UDP Header:
 - Port numbers (source and target processes), length, checksum

RTP Header Format

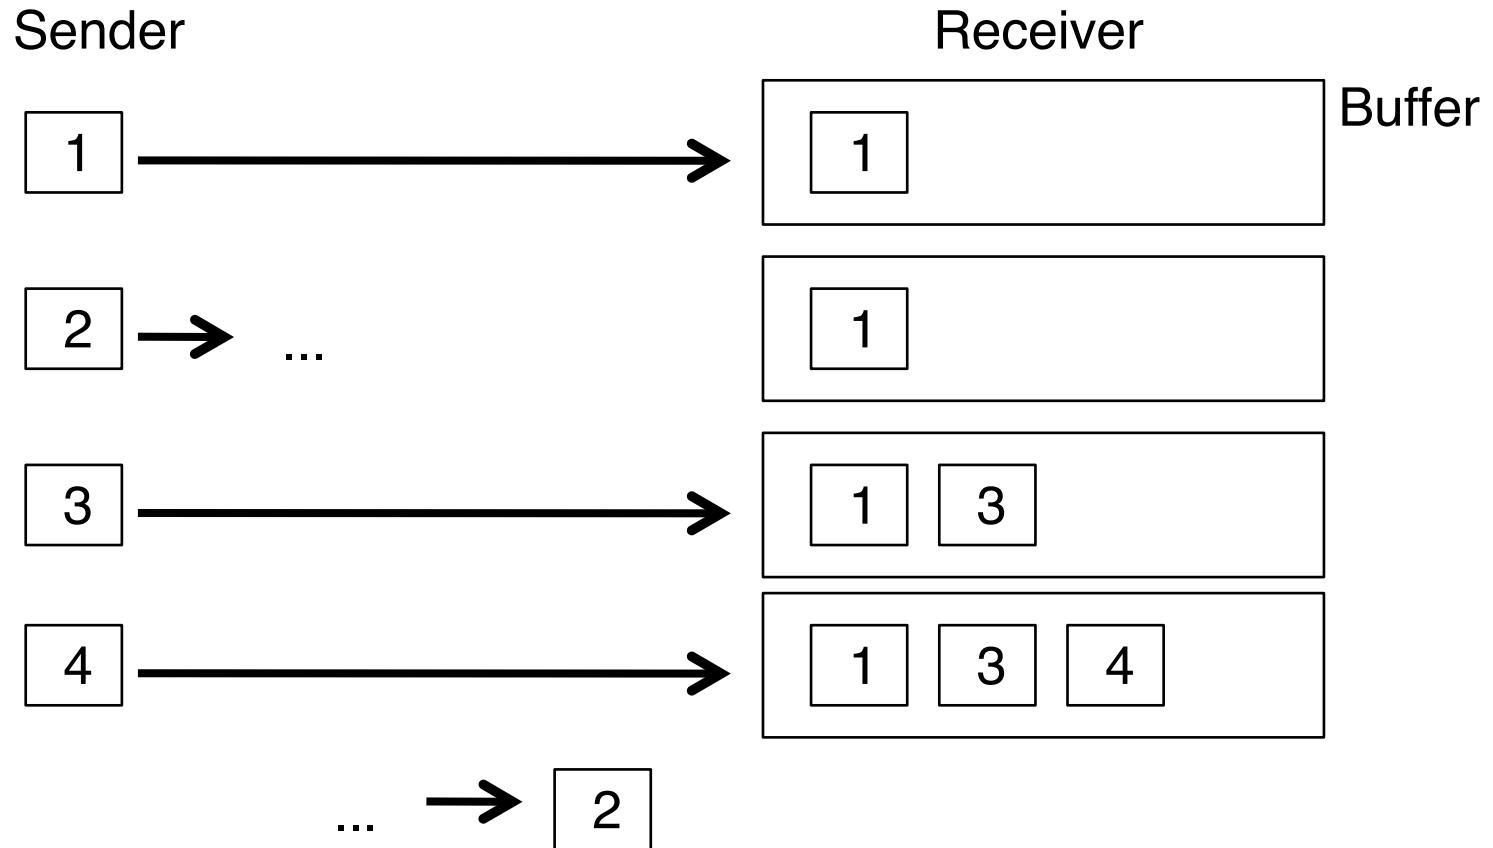

Payload Type (7 Bit)	Sequence Number (16 Bit)	...
Timestamp (32 Bit)		
Synchronization Source (SSRC) Identifier (32 Bit)		
Contributing Source (CSRC) Identifier (32 Bit) (repeated)		

- Payload Type: Source coding (codec used)
- SSRC: Identification of sending data source, defined basis for sequence numbers and time stamps
- CSRC (optional): Identifications for original data sources which have been *mixed* together to form the synchronization source

Buffer Size Allocation

- Streaming quality relies on
 - Features of the network, and
 - *Adaptive* codecs on client/server side
 - E.g. intelligent use of buffering
- *Constant* delay does not require buffering
- Buffers are necessary to deal with *jitter (packet delay variation)*
 - Varying network delays
- Estimation of buffer sizes
 - Based on preliminary test transmissions
 - Adaptively during content transmission
- Problem:
 - Keep buffers small to achieve proper “real-time”
 - Avoid “buffer underrun” in case of exceptionally long delays

Jitter and Loss Compensation

- Options for application on receiver side:
 - Wait (*not* adequate), repeat last packet (1), interpolate (between 1 and 3)
 - Missing audio information is difficult, missing video can be compensated

Adaptive Transmission Rate Control

- Application-level mechanism
- Define “low” and “high” thresholds on buffer
- Communication between client and server
 - Decrease effective transmission rate when high threshold is reached
 - Increase effective transmission rate when low threshold is reached
- Changing the effective transmission rate
 - Change sending rate
 - Change content quality (frame rate, resolution etc.)

Real-Time Control Protocol RTCP

- RTCP controls the transmission (not the setup of connection)
- RTCP periodically sends monitoring information to all participants in a streaming session
- Main functions of RTCP:
 - Feedback on QoS of transmission
 - » Information for adaptive codecs, e.g. whether problem is local or global
 - Identification of sender by “canonical name”
 - » Helpful when synchronization source changes
 - » Supports lip synchronization between audio and video
 - Number of participants in a session
 - » Adaptation of sending rate of RTCP control information to number of participants, to avoid network overload
 - Transmission of additional information, e.g. names of session participants

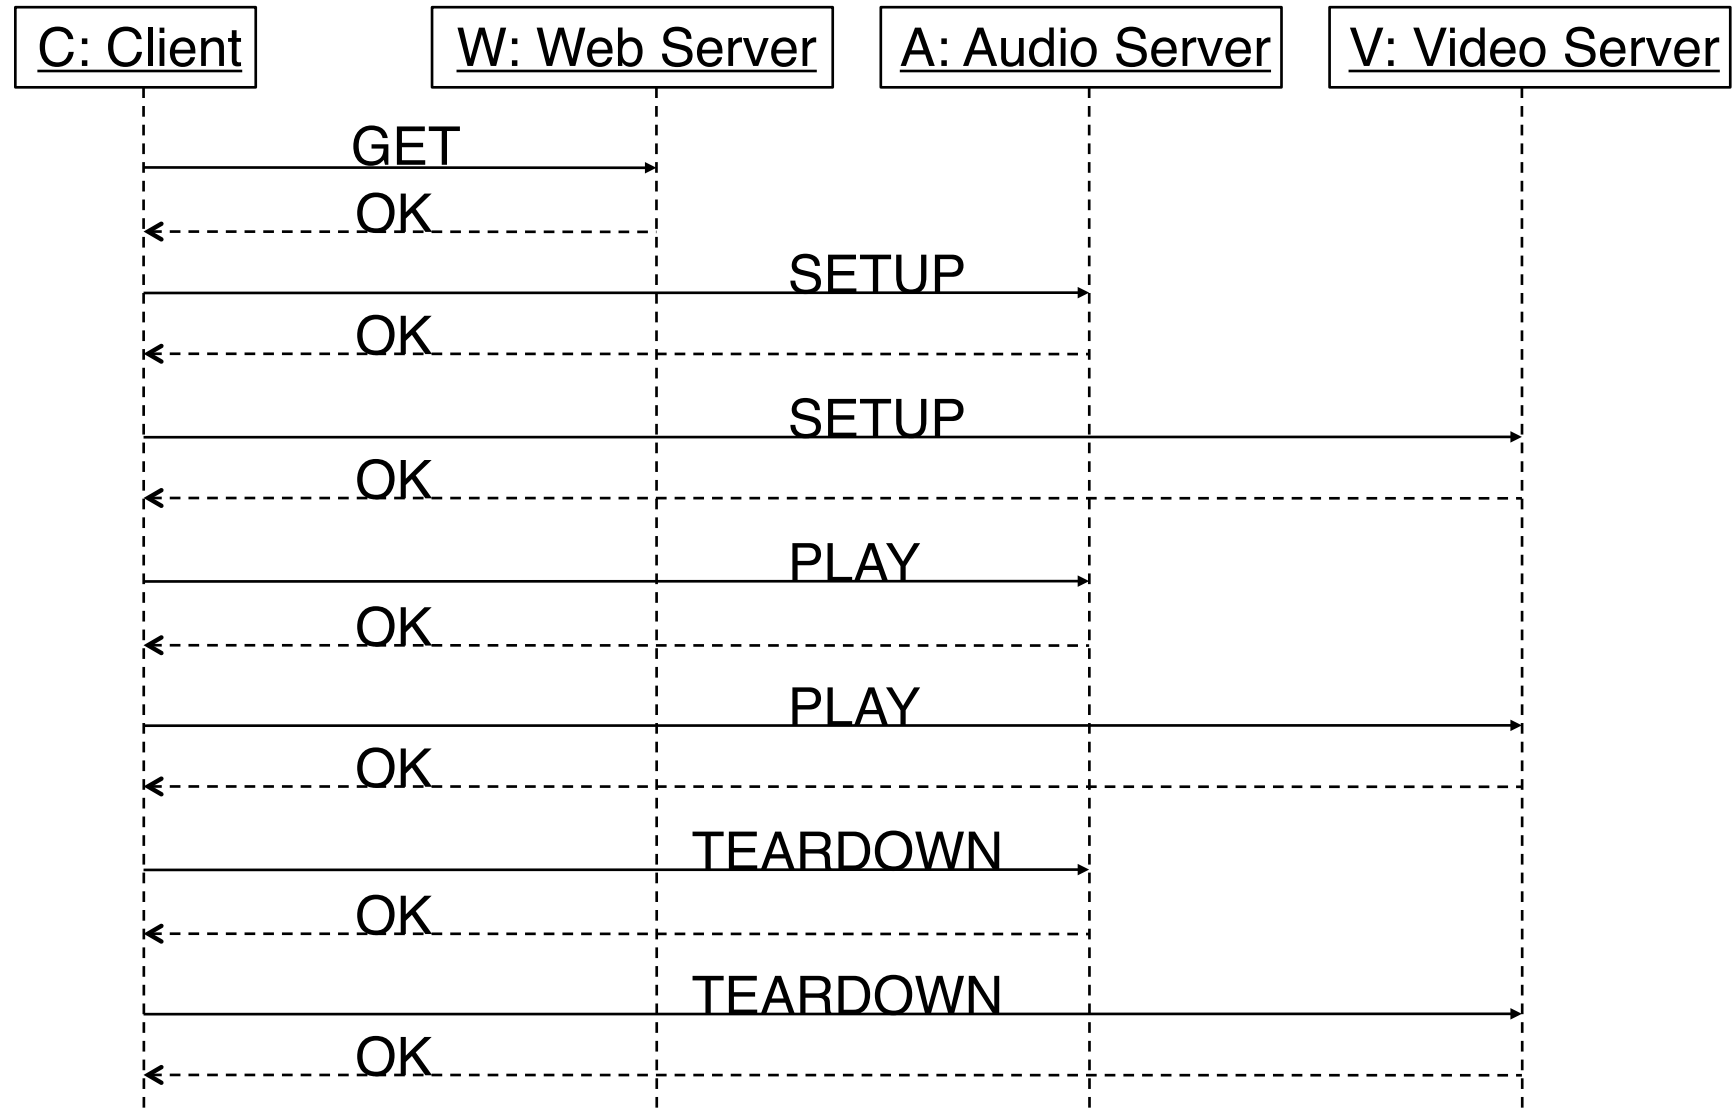

Real Time Streaming Protocol RTSP

- Client-server multimedia presentation protocol, designed specifically for streamed media
 - IETF (Internet Engineering Task Force) RFC (Request for Comments) 2326 (“MMUSIC” work group)
 - » February 1998, draft revision February 2004
 - “The Internet VCR remote control protocol” (www.rtsp.org)
 - Independent of the use of RTP for transport
 - Syntactically similar to HTTP 1.1 (carried over TCP or UDP)
- Main operations supported by RTSP:
 - Retrieval of media from media server
 - Invitation of a media server to a conference
- Key terminology
 - Aggregate control (e.g. for audio & video)
 - Server control (clients should be able to stop streaming from a server)
 - Transport & capability negotiation (e.g. disallowing a “seek” function)

Main Methods of RTSP

- SETUP:
 - Causes the server to allocate resources for a stream and create a RTSP session.
- PLAY:
 - Starts data transmission on a stream allocated via SETUP
 - Fast forward (scale ratio parameter)
- PAUSE:
 - Temporarily halts a stream without freeing server resources.
- REDIRECT:
 - Indicates that the session should be moved to new server / location
- PING:
 - Prevents the identified session from being timed out.
- TEARDOWN:
 - Frees resources associated with the stream. The RTSP session ceases to exist on the server.

Example Session with RTSP

10 Streaming Architectures

10.1 High-Level Streaming Architecture

10.2 Real-Time Data Transport

10.3 Scalability and Multicast

10.4 Selected Commercial Streaming Architectures

Literature:

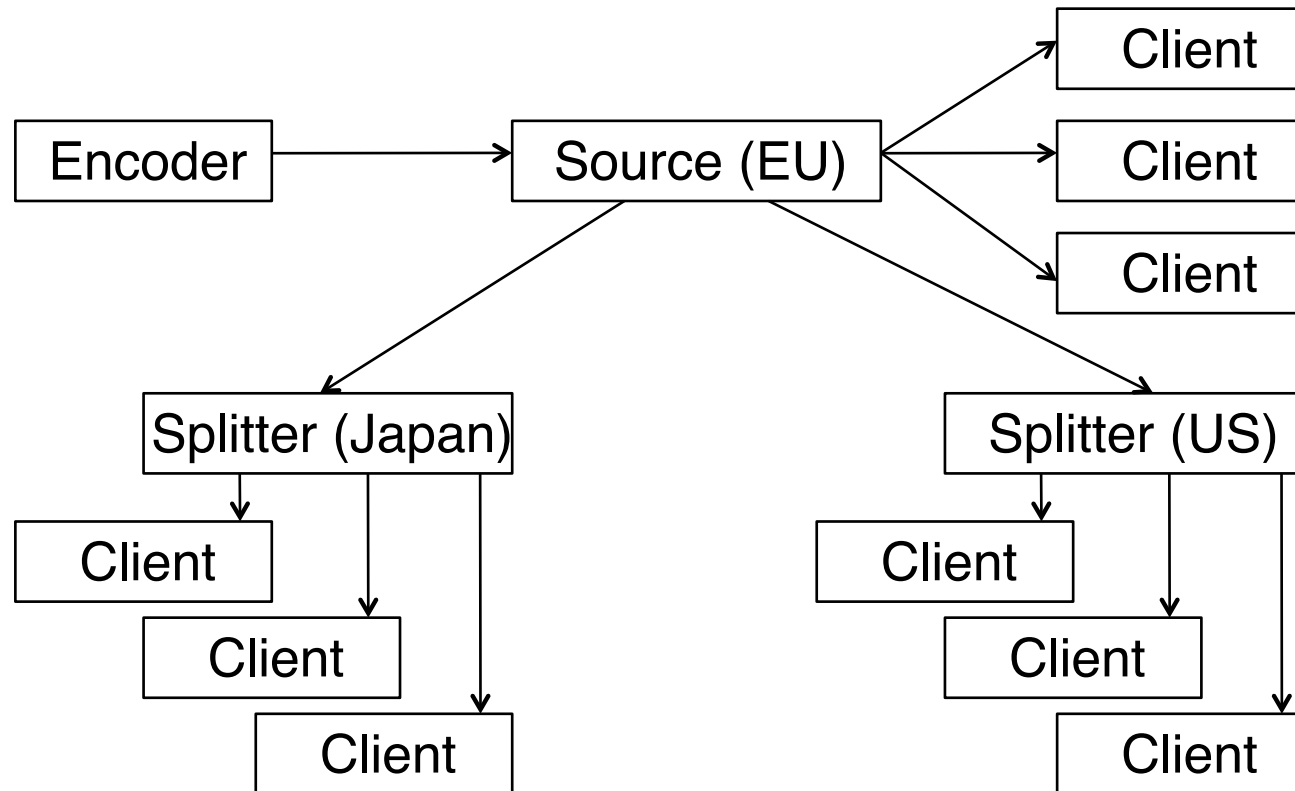

David Austerberry: The Technology of Video & Audio Streaming,
Focal Press 2002

Gregory C. Demetriades: Streaming Media, Wiley 2003

Xueyan Tang et al.: Web Content Delivery, Springer 2005

Splitting

- Video servers are limited in capacity
- Assuming clients at spatially distant locations
 - Intermediate, forwarding server is useful: “splitter”

Content Delivery Networks (CDN)

- Serve content closer to to the user
 - “edge serving”
- Main components of CDN:
 - Smart routing
 - Edge caching of content
 - Proxy serving
 - Splitting of live webcasts

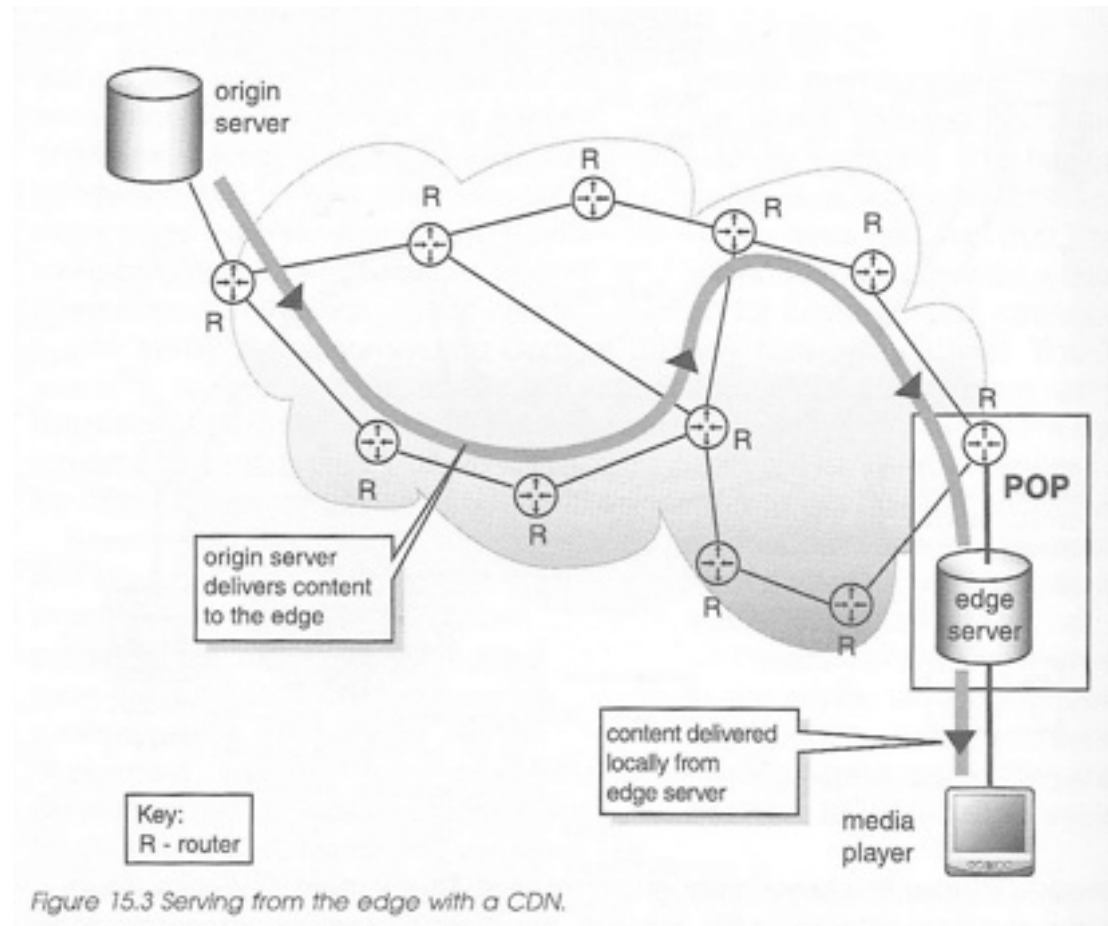

Figure 15.3 Serving from the edge with a CDN.

Figure from Austerberry 2002

Content Delivery Networks

- “Overlay server infrastructure”
 - Network of centrally operated Web and streaming servers
 - Geographically distributed, present in main ISP networks
 - Flexibly used for content from various sources
- Content delivery as a service
 - Content delivery service provider owns server infrastructure
 - Content owner pays for having content delivered to customers
- Examples:
 - Akamai (delivers 20% of all Web traffic according to akamai.com, 2012)
 - » Runs 95,000+ servers in 71 countries
 - InterNap CDN Services
 - » Traditionally specialized in media streaming (acquisition of VitalStream)
 - Amazon CloudFront
- Streaming of a/v media (e.g. movies) gains strategic importance

Example of Monitoring/Administration Interface

InterNap MediaConsole 5.0

The screenshot displays the InterNap MediaConsole 5.0 interface. The top navigation bar includes 'Dashboard', 'Reports', 'Media', 'Preferences', 'Upload', and 'Help'. The main dashboard area is divided into several sections:

- Latest Files:** A list of recent uploads with details like 'MediaConsole 5.0 Release'.
- Total Usage:** A table showing usage statistics for the current and previous months.
- Most Popular Directories:** A list of top-performing directories.
- Flash Player Versions:** A bar chart showing the distribution of different Flash player versions.
- Performance Review:** A table with metrics like 'View Count' and 'Byte Count'.
- Most Popular Files:** A list of the most viewed files.
- Total Viewers:** A histogram showing the number of unique viewers over time.
- Viewing Lengths:** A bar chart showing the duration of video views.

On the right side, there is a 'Geographic Traffic' map showing global viewer distribution. A 'Reports' window is overlaid on the bottom right, featuring a 'Run Recent Report' dropdown, 'Scheduled Reports' link, and a 'Report Criteria' section with filters for Report Type, Date Range, Delivery Type, Auth Type, Display, and Chart. Below the filters is a table titled 'Monthly File data for Sep 2009'.

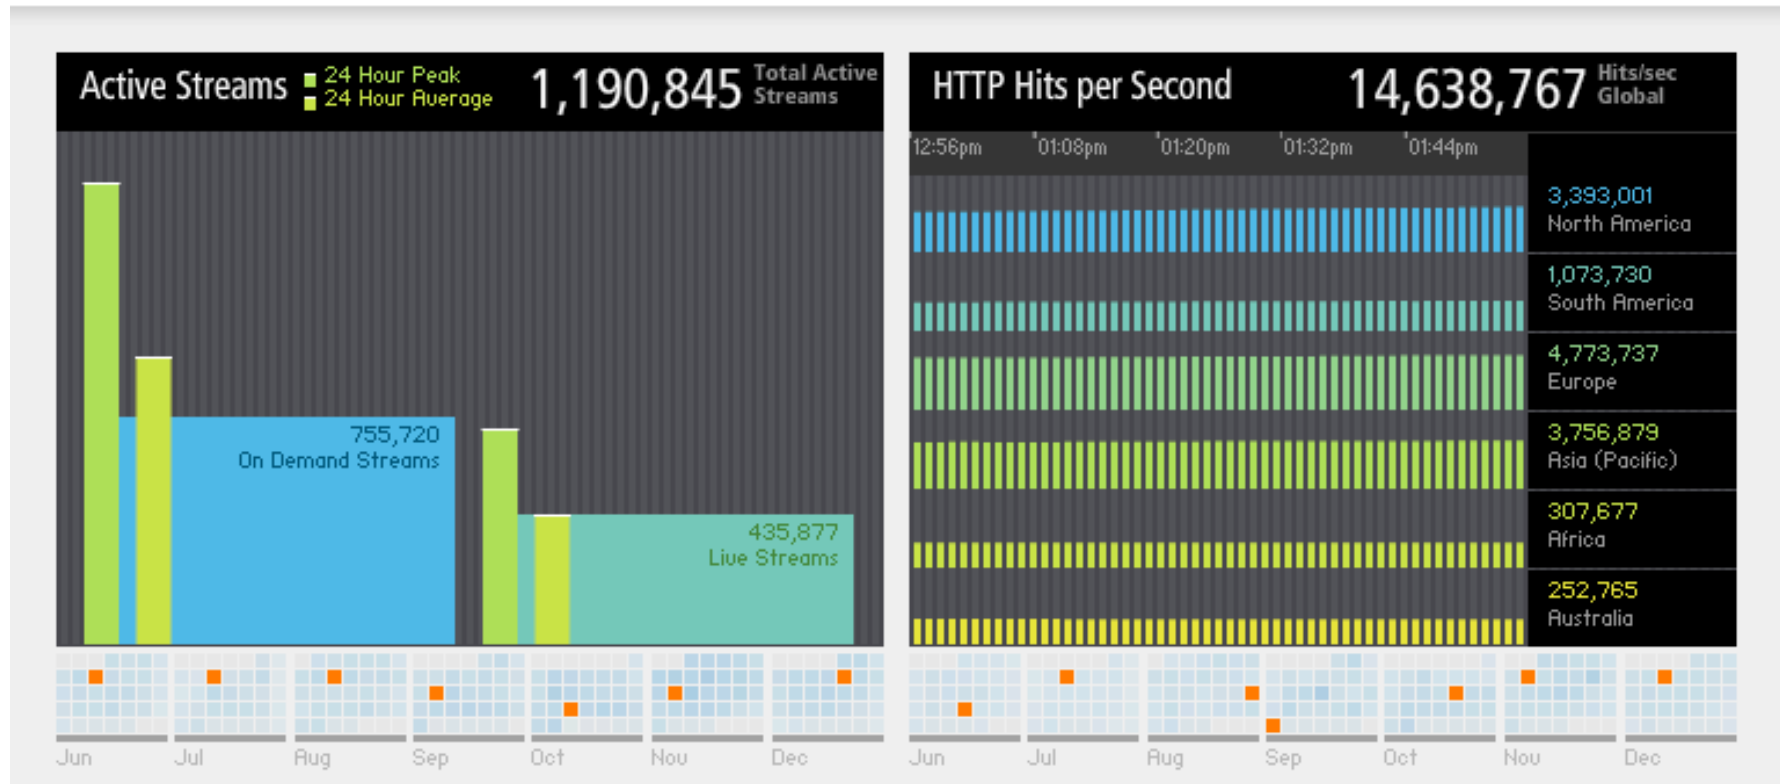

Name	Views	Bandwidth (MB)	Duration (Sec)	Avg Duration (Sec)
ustream@internap 199131	1,463,318	25,482,091.7	685,761,978	468.6
ustream@internap 1296823	1,233,380	8,954,796.8	324,200,815	262.9
ustream@internap 760651	1,218,250	7,807,852.3	319,886,856	262.6
ustream@internap 486536	1,152,863	11,514,624.7	568,185,456	488.6
ustream@internap 1351963	1,029,084	5,801,407.0	260,202,584	252.8
ustream@internap 1296731	976,253	8,892,837.8	295,794,166	303.0
ustream@internap 1489608	891,663	11,244,782.8	344,639,479	386.5
ustream@internap 660240	874,120	11,777,854.8	267,768,876	307.8

Example: Visualizing Akamai

Visualizing Akamai <http://www.akamai.com/html/technology/dataviz3.html>

Akamai handles 20% of the world's total Web traffic, providing a unique view into what's happening on the Web - what events are generating traffic, how much, from where, and why. Bookmark this page to get a feel for the world's online behavior at any given moment - how much rich media is on the move, the sheer volume of data in play, the number and concentration of worldwide visitors, and average connection speeds worldwide.

- Visualizing Akamai
- Return to Visualizing the Internet
- Methodology and Data Collection

Key Problems in CDNs

- Replica placement:
 - Where to place copies of web sites or other content
 - Problem is in general NP-hard (Karlsson, Karamolis, 2004)
 - Replica placement algorithms (RPA) achieve a suboptimal solution within reasonable time frame
 - Global information is difficult or costly to get - RPA uses local information mostly
 - CDN providers typically try to observe global network performance to some extent
- Request routing:
 - Mechanism and policy of redirecting client requests to a suitable server containing the requested content
 - Redirection algorithm: Decides what node to direct a client request to
 - Redirection mechanism: Way of redirecting the request (client, network)

Streaming Media in CDN

- General idea: Local proxy caching. But: ...
 - Huge size (1 KB vs. 100 MB)
 - » To cache only portions of the original?
 - Intensive bandwidth usage
 - » Minimizing bandwidth consumption as primary consideration
 - High interactivity
 - » E.g. premature termination is frequent (Chen et al. 04: approx. 90 %)
 - However: Media content is rather static (compared to Web pages)
- Caching algorithms
 - Different for homogeneous and heterogeneous clients (in bandwidth/format)
 - Sliding interval caching: sequential access, mainly effective for similar requests in short time period
 - Prefix caching: Saves time to load remaining parts
 - Segment caching: Generalization of prefix caching to support fast forward
 - Rate-split caching: Lower layer from original server, higher layer from proxy
 - Co-operative proxy caching (e.g. Acharya/Smith: MiddleMan)

Unicast, Broadcast, Multicast, Anycast

Unicast:
One specific receiver

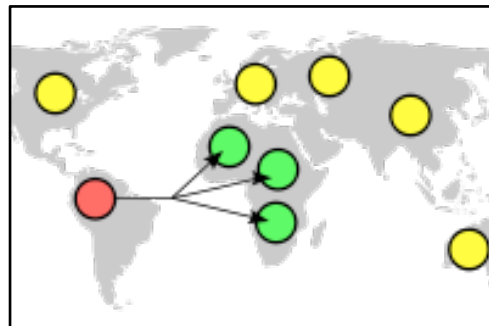

Broadcast:
Many receivers, all on the network

Multicast:
Many receivers, all of a specific group

Anycast:
One receiver, "nearest" of a specific group

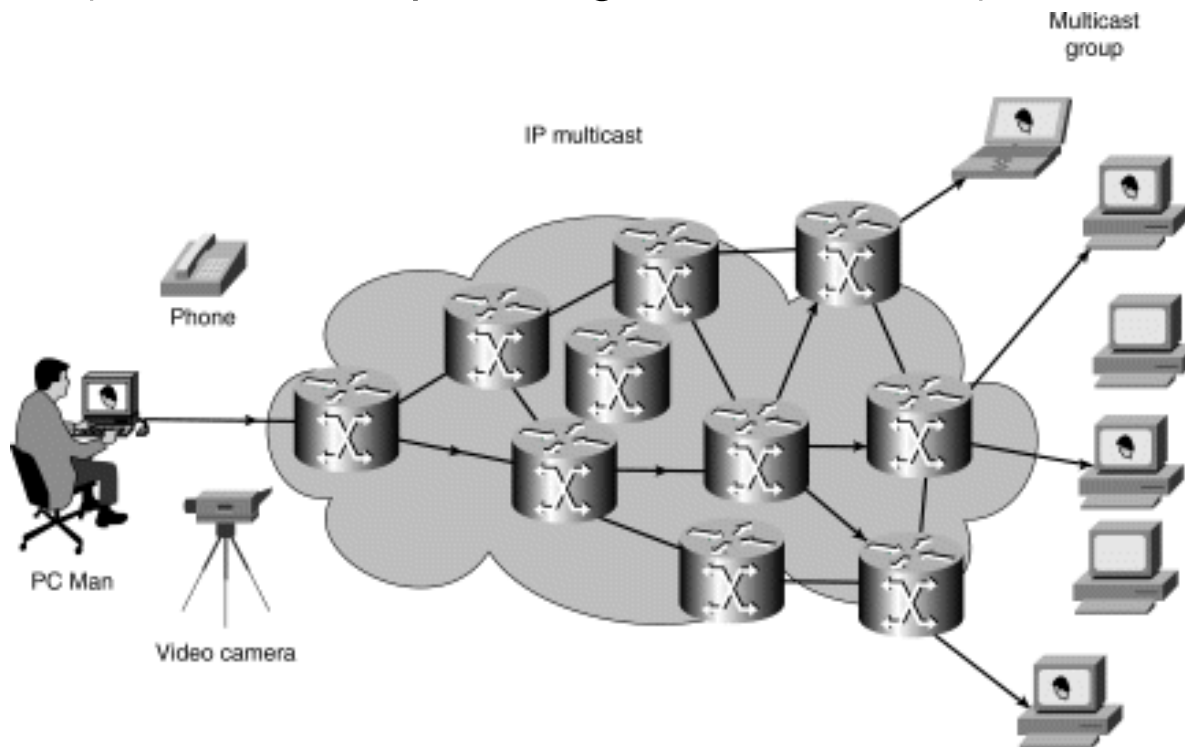

Geocast:
Many receivers, all of a geographic region

Pictures: Wikipedia

IP Multicast

- Multicast relatively easy to integrate in routers
- IP address class D (224.0.0.0 through to 239.255.255.255) reserved for multicast (multicast groups)
- Registration/deregistration with IGMP (Internet Group Management Protocol)

- Reliable multicast:
e.g. “Mbone”
overlay
network
- Multicast still rarely
used in today’s
Internet

IP Version 6

- Next generation of the IP protocol
- 128 Bit address space
 - Intended to relieve shortage of IP v4 addresses
- Built-in support for multicast
 - Specific multicast addresses
- Uptake of IP version 6 is (strangely) slow

10 Streaming Architectures

10.1 High-Level Streaming Architecture

10.2 Real-Time Data Transport

10.3 Scalability and Multicast

10.4 Selected Commercial Streaming Architectures

RealNetworks, QuickTime, Windows Media

Market Shares of Streaming Players

Back in 2000:
Real 28%
Win 22%
QT 4%
 (streaming
 media.com)

Prediction: iTunes+QT will pass Windows Media by 2012

Video Codec Usage

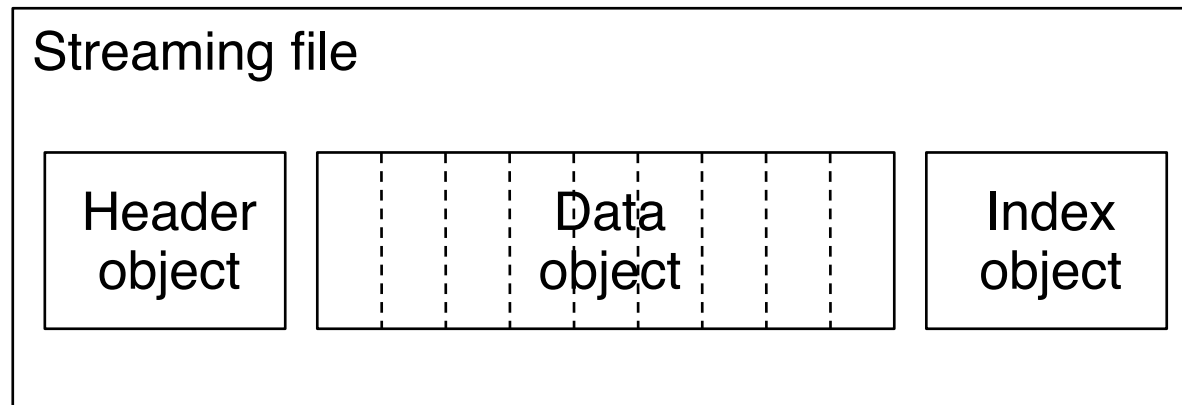

from WebsiteOptimization.com

RV = Real Video

WMV = Windows Media Video

Streaming File Formats

(from ASF)

- Header, Data: As in other audio/video formats
 - Additional timing control information used to manage flow rate
- Index Object: Aid for client navigation
- Main streaming file formats:
 - Microsoft: Advanced Streaming Format (ASF), Windows Media Video (WMV), Windows Media Audio (WMA)
 - RealNetworks: RealMedia (RM), RealAudio (RA)
 - Apple: QuickTime Hinted Movie (MOV)

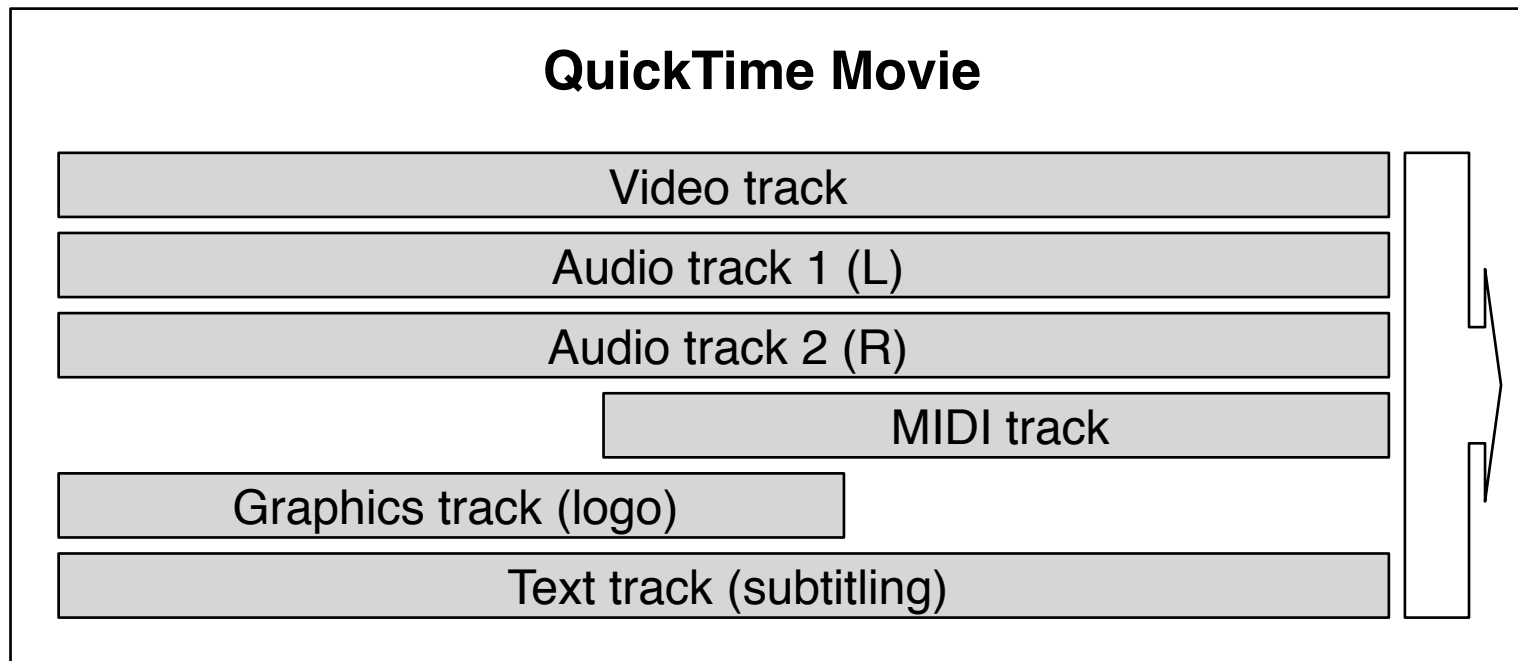

Apple QuickTime

- Platform-independent multimedia architecture
 - Supports MacOS and Windows
- History:
 - First version (1.0) for MacOS 6 in 1991
 - QuickTime 2.0 also for Windows 1994
 - Streaming support since version 4.0 (1999)
 - Current version 10.1 for MacOS 10.7 (and 7.7.1 for Windows)
- QuickTime consists of:
 - Framework, API, file format
- Applications using QuickTime:
 - QuickTime Player, iTunes, Logic, Final Cut, Premiere, Avid, ...
- Codec support:
 - Open plugin architecture (*QuickTime components*)
 - Huge selection of pre-installed components
- Digital Rights Management is intrinsic part of QuickTime

QuickTime Movie Files

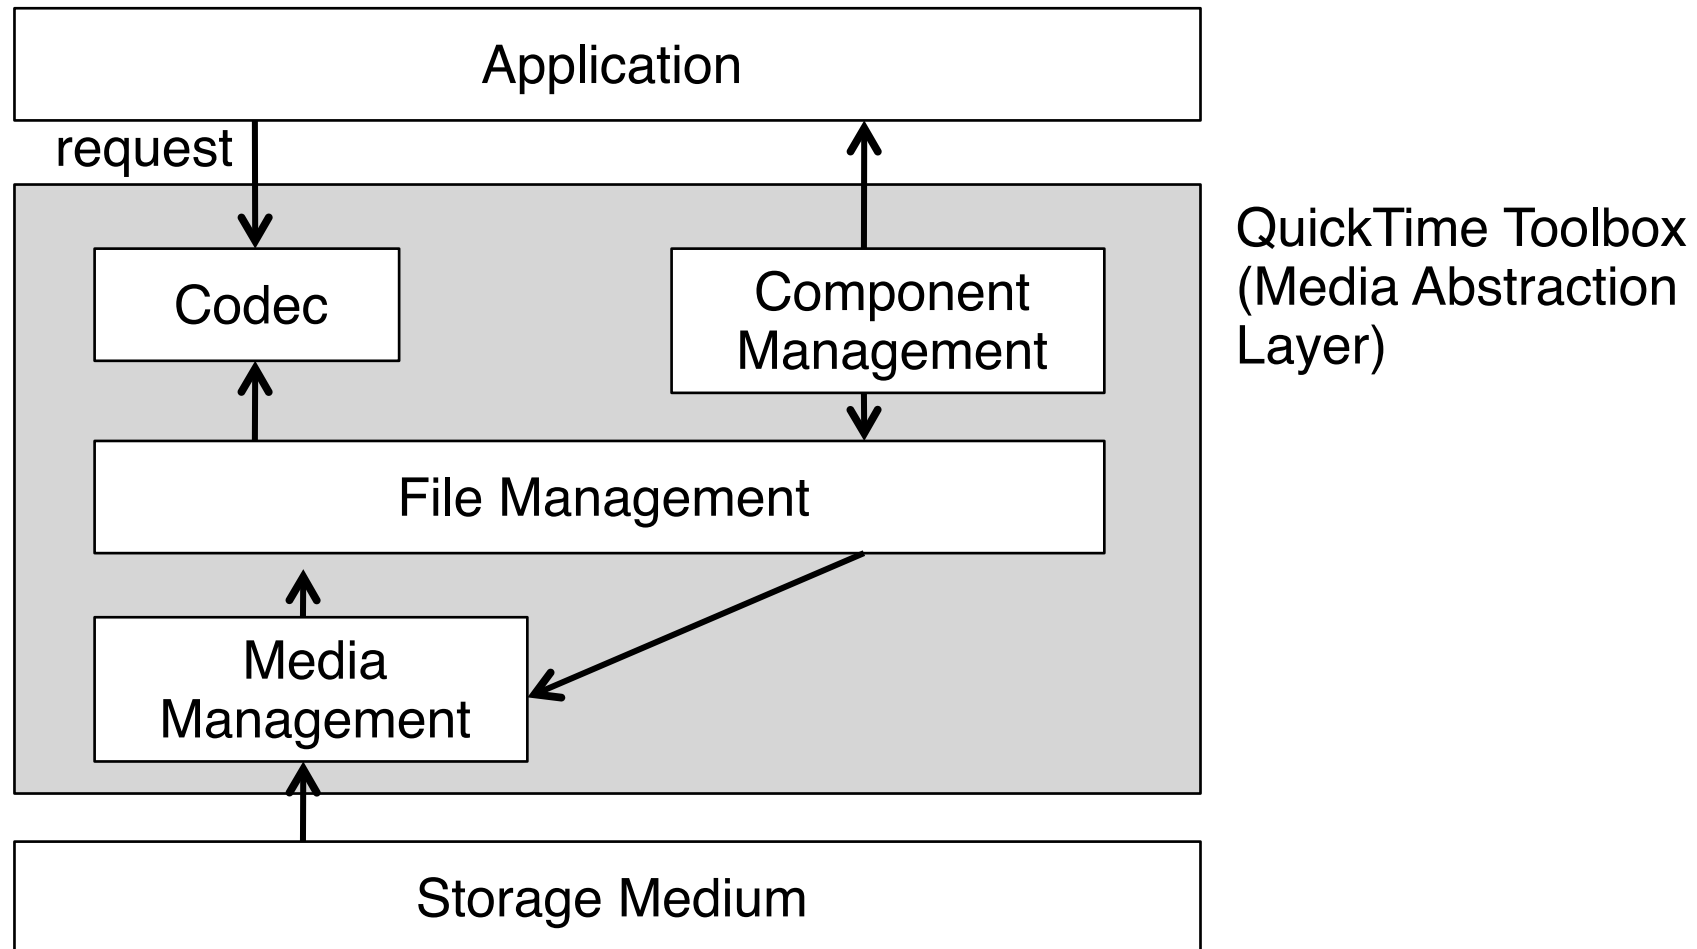

- Modular and flexible architecture
 - Multimedia files organized in tracks
 - Example:

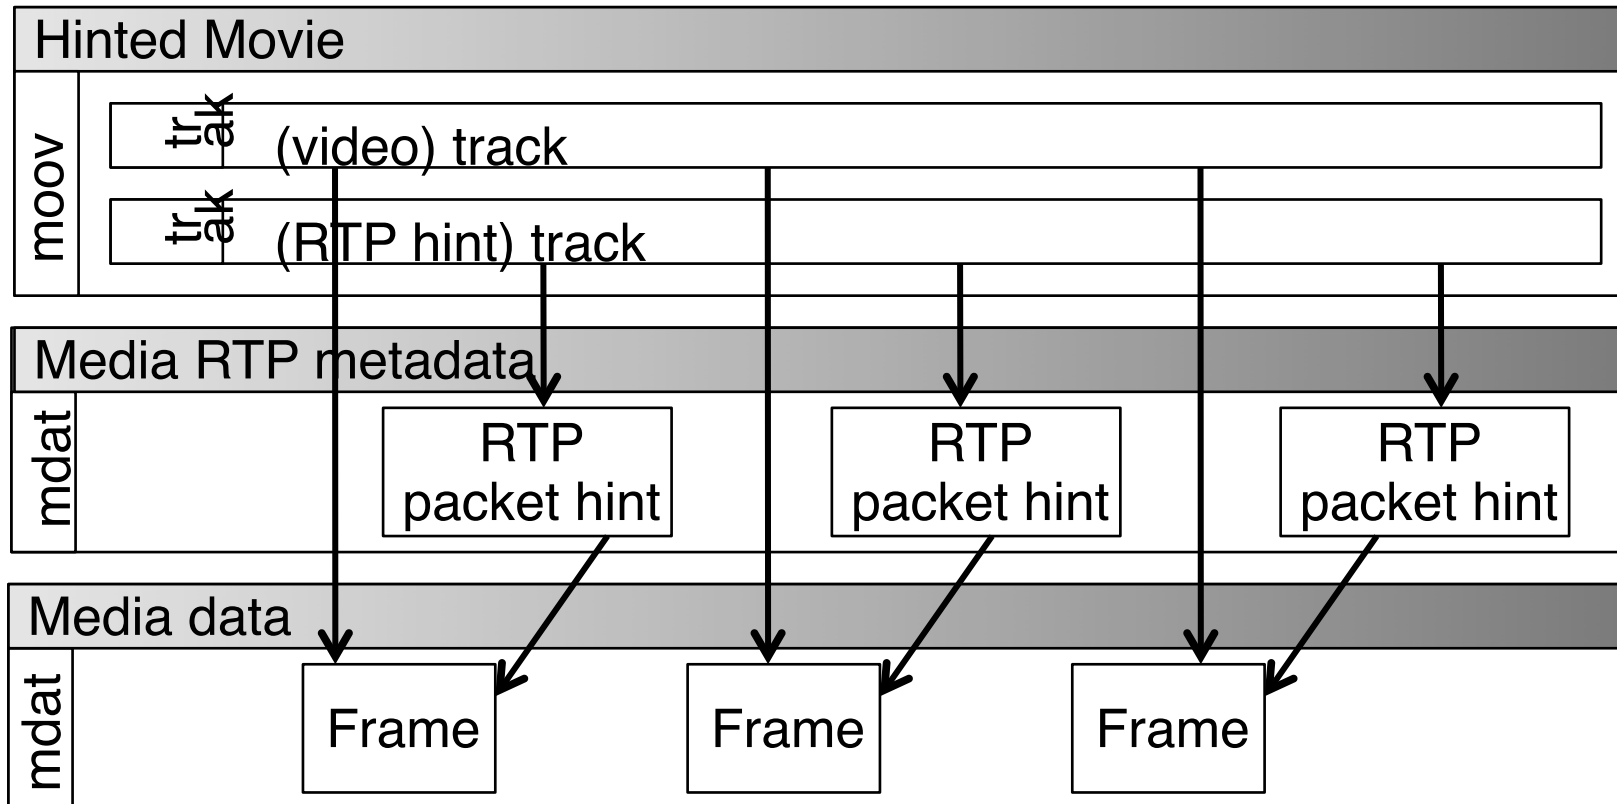

Types of QuickTime Tracks

- Movie track: Copyright info, annotations, ...
- Audio track(s)
- Text track: Titles, subtitles, credits, notes, ...
- Sprite track: Images with animatable, programmable behaviours
- Flash track: SWF animation
- QuickTime VR track: VR objects, panorama movies
- Video track: Digital video, 3D animation, ...
- Music track: MIDI
- Chapter track: Inserts addressable entry points
- 3D track: Contains QuickDraw 3D metafile objects
- Streaming track: References to streams from a server source
- Hint track: Additional information for streaming (see below)

QuickTime Media Abstraction Layer

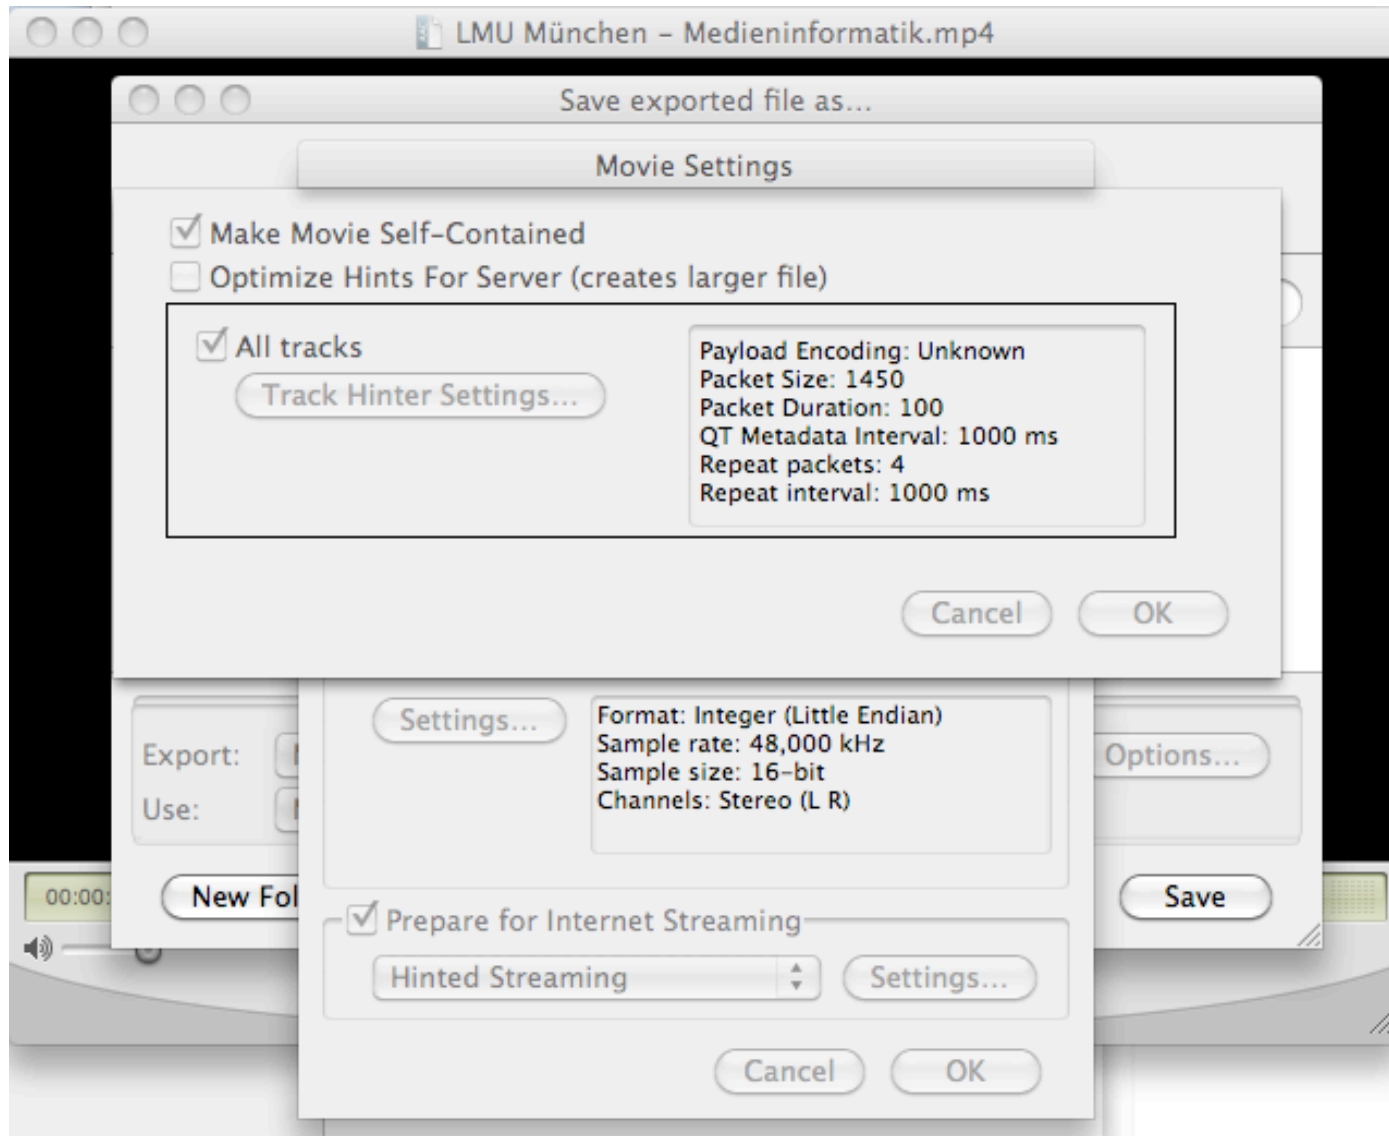

Hint Tracks in QuickTime and MPEG-4

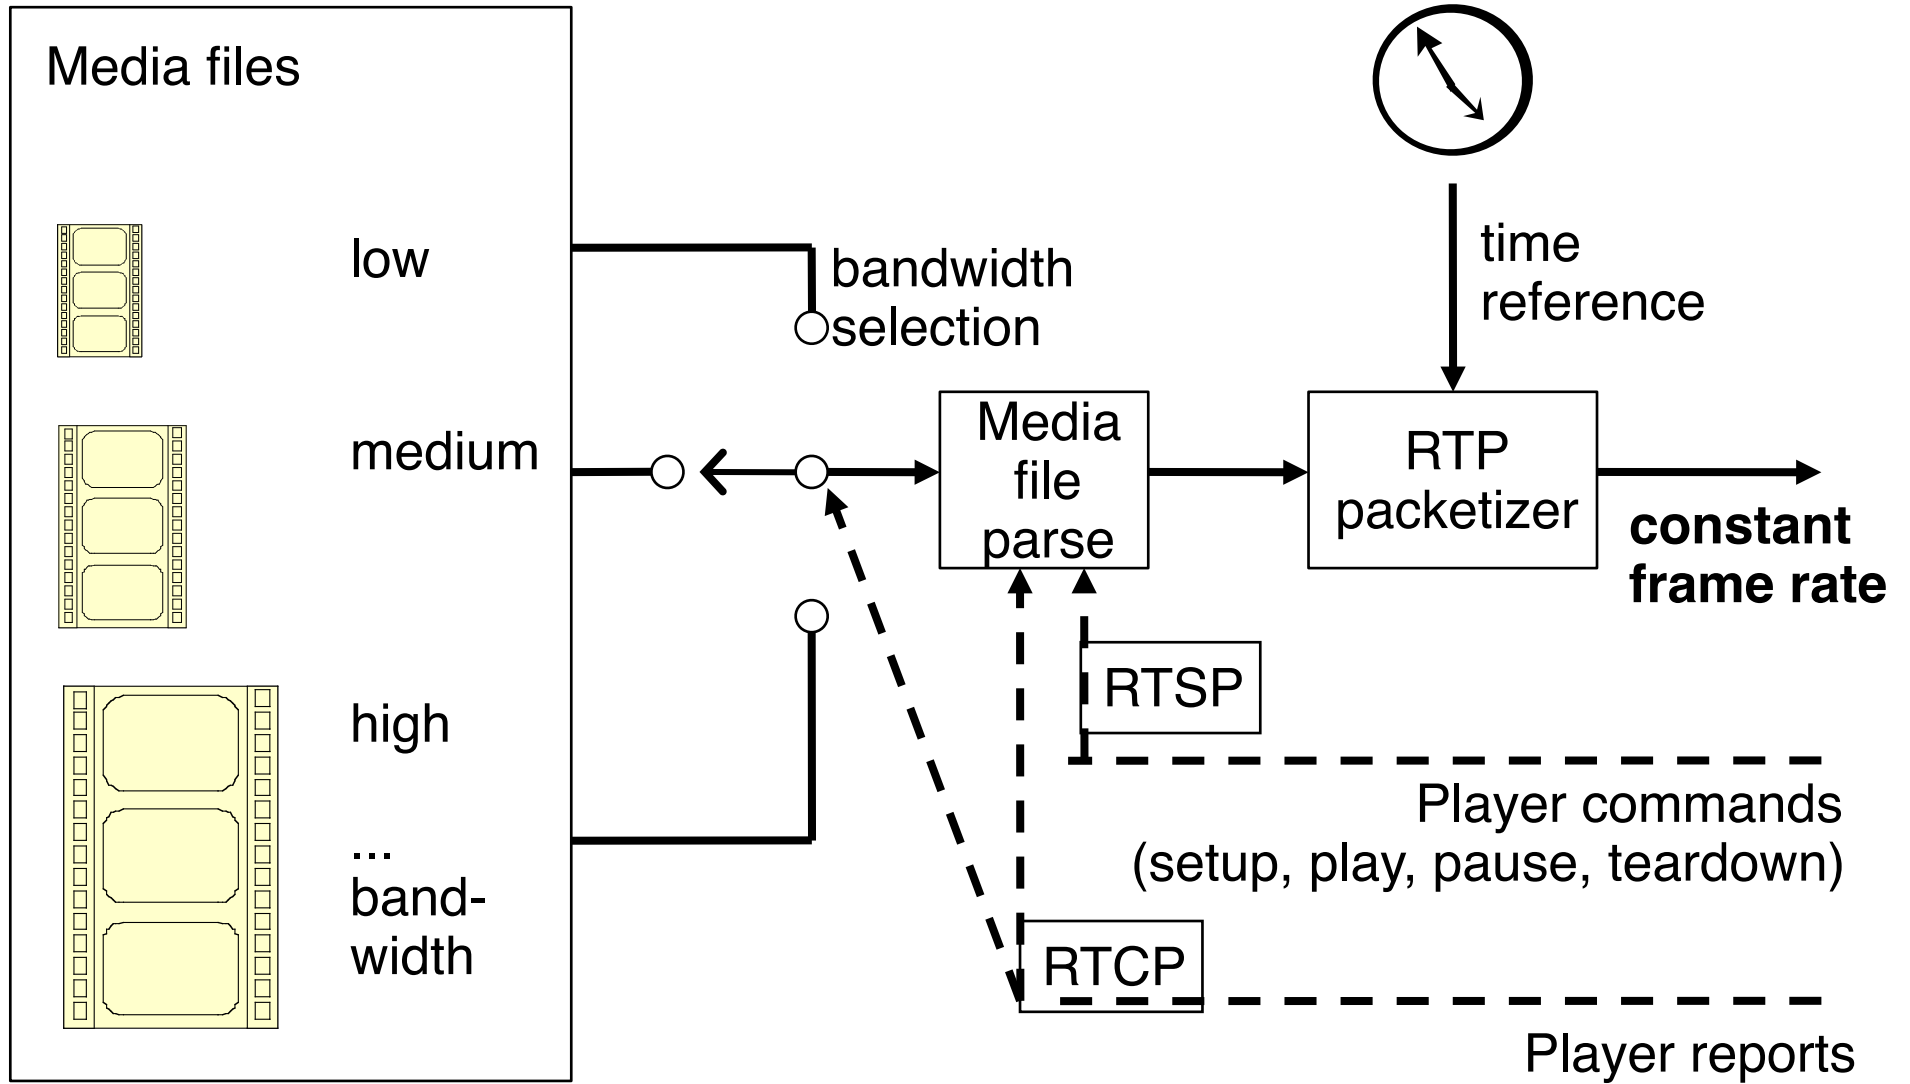

- Hint track gives server software pointers to the RTP information to serve the relevant media chunks
- Concept from QuickTime, integrated in MPEG-4 (streaming)

Adding a Hint Track (*Steuerspur*)

Adapting to Network Congestion

Realisations for Rate Adaptation

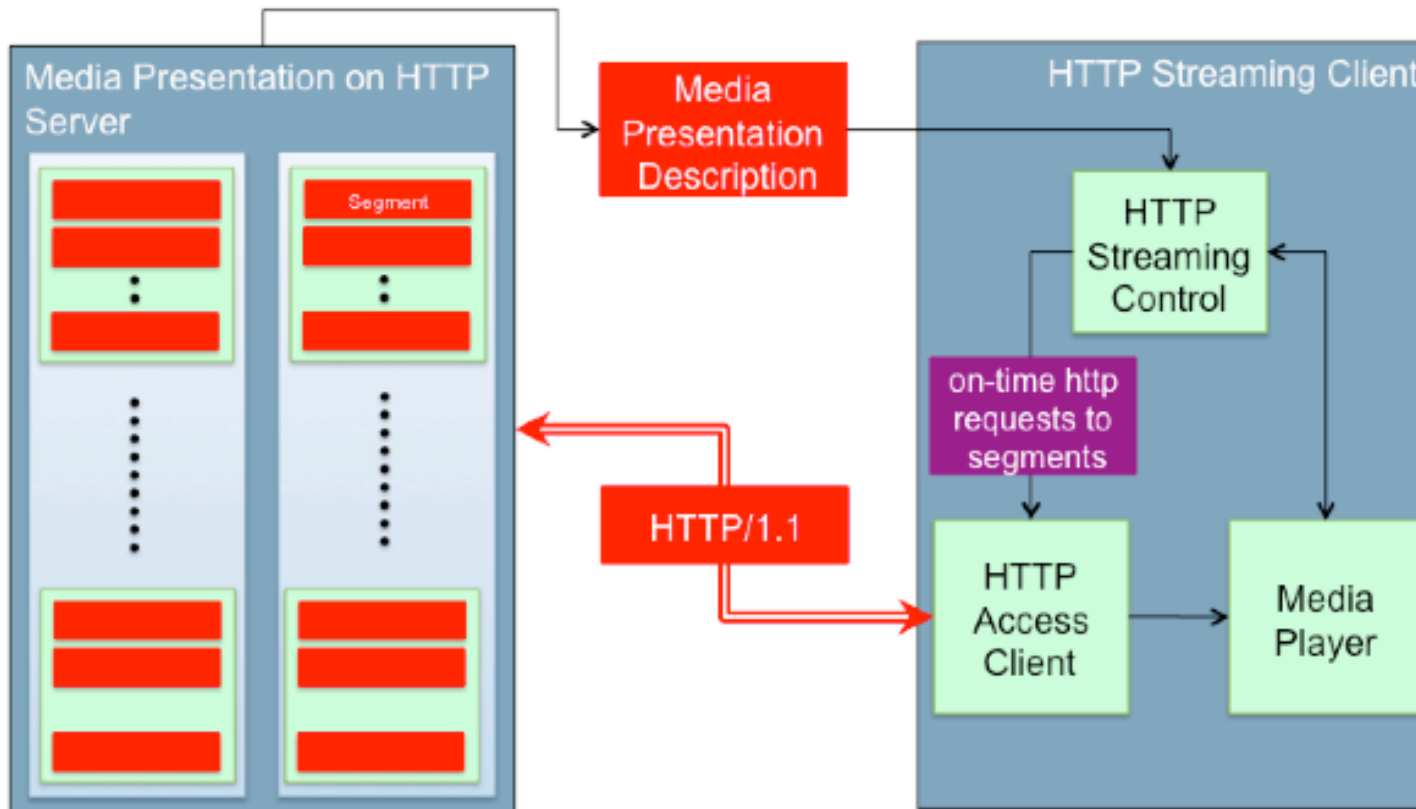

- Multiple bit rate files
 - RealNetworks “SureStream”, Windows Media “multiple bit rate”
 - Several bit rates in one file
 - Compatible only with streaming servers, not with Web servers
 - Adaptation by change of picture size not supported
- Alternate movies (QuickTime)
 - Player receives pointers to assemble the actual program
 - Usable for adapting bit rate and other parameters
 - Usable also for different language versions and other applications
- MPEG-4 Scalable Streams
 - Similar to “progressive” technique in picture compression
 - Basic low-resolution stream transmitted
 - Additional “helper” streams can add more detail and improve quality

Trend: Adaptive HTTP Streaming

- Conventional streaming technologies (push-model, based on RTP, RTSP etc.):
 - Apple QuickTime Streaming
 - Microsoft Windows Media
 - Adobe Flash
- Emerging adaptive streaming technologies (pull-model, based on HTTP):
 - Apple HTTP Live Streaming
 - Microsoft Smooth Streaming
 - Adobe HTTP Dynamic Streaming
- Basic idea: Small video file fragments
 - Fragments exist at different bit rates
 - Index file for all available fragments
 - Client requests appropriate next fragment by GET request

3GP-DASH: Open Standard for HTTP Streaming

- Dynamic Adaptive Streaming over HTTP

3rd Generation
Partnership
Project (3GPP)
